

Programming with Big Data in R

George Ostrouchov

February 17, 2014

The pbdR Core Team

Wei-Chen Chen¹
 George Ostrouchov²
 Pragneshkumar Patel³
 Drew Schmidt³

Support

This work used resources of [National Institute for Computational Sciences](#) at the University of Tennessee, Knoxville, which is supported by the Office of Cyberinfrastructure of the U.S. National Science Foundation under Award No. ARRA-NSF-OCI-0906324 for NICS-RDAV center. This work also used resources of the [Oak Ridge Leadership Computing Facility](#) at the Oak Ridge National Laboratory, which is supported by the Office of Science of the U.S. Department of Energy under Contract No. DE-AC05-00OR22725.

¹Department of Ecology and Evolutionary Biology

 University of Tennessee, Knoxville TN, USA

About This Presentation

Speaking Serial R with a Parallel Accent

The content of this presentation is based in part on the **pbdDEMO** vignette *Speaking Serial R with a Parallel Accent*

<http://goo.gl/HZkRt>

It contains more examples, and sometimes added detail.

About This Presentation

Installation Instructions

Installation instructions for setting up a pbdR environment are available:

<http://r-pbd.org/install.html>

This includes instructions for installing R, MPI, and pbdR.

Contents

- 1 Introduction
- 2 pbdR
- 3 Introduction to pbdMPI
- 4 The Generalized Block Distribution
- 5 Basic Statistics Examples
- 6 Introduction to pbdDMAT and the DMAT Structure
- 7 Examples Using pbdDMAT
- 8 Wrapup

A Concise Introduction to Parallelism

What is Parallelism?

- Doing more than one thing at a time.
- The simultaneous use of multiple compute resources to solve a computational problem.

A Concise Introduction to Parallelism

Kinds of Parallelism

- *Data Parallelism*: Data is distributed
- *Task Parallelism*: Tasks are distributed

(This is a gross oversimplification)

pbdR Paradigms: Data Parallelism

Data parallelism:

- No one processor/node owns all the data.
- Processors own local pieces of a (conceptually) larger, global object

Task parallelism:

- Often involves different tasks to the same data.

A Concise Introduction to Parallelism

Parallel Programming Vocabulary: Difficulty in Parallelism

- ① *Implicit parallelism*: Parallel details hidden from user
- ② *Explicit parallelism*: Some assembly required. . .
- ③ *Embarrassingly Parallel*: Also called *loosely coupled*. Obvious how to make parallel; lots of independence in computations.
- ④ *Tightly Coupled*: Opposite of embarrassingly parallel; lots of dependence in computations.

```

A Concise Introduction to Parallelism

Speedup

- *Wallclock Time*: Time of the clock on the wall from start to finish
- *Speedup*: unitless measure of improvement; more is better.

$$S_{n_1, n_2} = \frac{\text{Run time for } n_1 \text{ cores}}{\text{Run time for } n_2 \text{ cores}}$$

- n_1 is often taken to be 1
- In this case, comparing parallel algorithm to serial algorithm

Speedup

Good Speedup

Bad Speedup

Recall: Shared and Distributed Memory Machines

Shared Memory

Direct access to read/change memory (one node)

Distributed

No direct access to read/change memory (many nodes); requires communication

```

Problems with Serial R

- ❶ Slow.
- ❷ If you don't know what you're doing, it's *really* slow.
- ❸ Performance improvements usually for small machines.
- ❹ Very ram intensive.

R and Parallelism

The solution to many of R's problems is parallelism. However ...

What we have

- ① Mostly serial.
- ② Mostly not distributed
- ③ Data parallelism mostly explicit

What we want

- ① Mostly parallel.
- ② Mostly distributed.
- ③ Mostly implicit.

Programming with Big Data in R (pbdR)

Striving for *Productivity, Portability, Performance*

- *Free^a* R packages.
- Bridging high-performance C with high-productivity of R
- Scalable, big data analytics.
- Distributed data details implicitly managed.
- Methods have syntax *identical* to R.
- Powered by state of the art numerical libraries (MPI, ScaLAPACK, ...)

^aMPL, BSD, and GPL licensed

oooooooooo
oooooooooo
```

```
oooo
ooooo
ooo
```

Batch Execution

- Non-interactive
- Use

```
1 Rscript my_script.r
```

or

```
1 R CMD BATCH my_script.r
```

- In parallel:

```
1 mpirun -np 2 Rscript my_par_script.r
```

```

oooooooooooo

```

Single Program/Multiple Data (SPMD)

- SPMD is a programming *paradigm*.
- Not to be confused with SIMD.
- SPMD utilizes MIMD architecture computers.
- Arguably the simplest extension of serial programming.

```

oooooooooooo
oooooooooooo
oooooooooooo

```

```

oooooooooo
oooooooooo
oooooooooo

```

```

oooo
ooooo
ooo

```

Single Program/Multiple Data (SPMD)

- Difficult to describe, easy to do. . .
- Only one program is written, executed in batch on all processors.
- Different processors are autonomous; there is no manager.
- The dominant programming model for large machines.

Contents

- 3 Introduction to pbdMPI
 - Managing a Communicator
 - Reduce, Gather, Broadcast, and Barrier
 - Other pbdMPI Tools

Message Passing Interface (MPI)

- *MPI*: Standard for managing communications (data and instructions) between different nodes/computers.
- *Implementations*: OpenMPI, MPICH2, Cray MPT, ...
- Enables parallelism (via communication) on distributed machines.
- *Communicator*: manages communications between processors.

MPI Operations (1 of 2)

- **Managing a Communicator:** Create and destroy communicators.
`init()` — initialize communicator
`finalize()` — shut down communicator(s)
- **Rank query:** determine the processor's position in the communicator.
`comm.rank()` — “who am I?”
`comm.size()` — “how many of us are there?”
- **Printing:** Printing output from various ranks.
`comm.print(x)`
`comm.cat(x)`
WARNING: only use these functions on *results*, never on yet-to-be-computed things.

Quick Example 1

Rank Query: 1_rank.r

```

1 library(pbdMPI, quiet = TRUE)
2 init()
3
4 my.rank <- comm.rank()
5 comm.print(my.rank, all.rank=TRUE)
6
7 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 1_rank.r
```

Sample Output:

```

1 COMM.RANK = 0
2 [1] 0
3 COMM.RANK = 1
4 [1] 1

```

```

oooooooooooo
oooooooooooo
oooooooooooo

```

```

ooooo
oooo

```

```

ooo●
oooooooooo
oooooo

```

```

oooo
ooo
ooo

```

```

oooo
ooo
ooo

```

```

oooooooooo
oooooooooo
oooooooooo

```

```

ooooo
ooooo
ooo

```

Quick Example 2

Hello World: 2_hello.r

```

1 library(pbdMPI, quiet=TRUE)
2 init()
3
4 comm.print("Hello, world")
5
6 comm.print("Hello again", all.rank=TRUE, quiet=TRUE)
7
8 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 2_hello.r
```

Sample Output:

```

1 COMM.RANK = 0
2 [1] "Hello, world"
3 [1] "Hello again"
4 [1] "Hello again"

```

MPI Operations

- 1 Reduce
- 2 Gather
- 3 Broadcast
- 4 Barrier

Reductions — Combine results into single result

```

oooooooooooo
oooooooooooo
oooooooooooo

```

```

ooooo
oooo

```

```

oooo
oo●ooooo
oooooo

```

```

oooo
ooo
ooo

```

```

oooo
ooo
ooo

```

```

oooooooooo
oooooooooo
oooooooooo

```

```

ooooo
ooooo
ooo

```

Reduce, Gather, Broadcast, and Barrier

Gather — Many-to-one

Broadcast — One-to-many

Barrier — Synchronization

MPI Operations (2 of 2)

- Reduction:** each processor has a number x ; add all of them up, find the largest/smallest,
`reduce(x, op='sum')` — reduce to one
`allreduce(x, op='sum')` — reduce to all
- Gather:** each processor has a number; create a new object on some processor containing all of those numbers.
`gather(x)` — gather to one
`allgather(x)` — gather to all
- Broadcast:** one processor has a number x that every other processor should also have.
`bcast(x)`
- Barrier:** “computation wall”; no processor can proceed until *all* processors can proceed.
`barrier()`

Quick Example 3

Reduce and Gather: 3_gt.r

```

1 library(pbdMPI, quiet = TRUE)
2 init()
3
4 comm.set.seed(diff=TRUE)
5
6 n <- sample(1:10, size=1)
7
8 gt <- gather(n)
9 comm.print(unlist(gt))
10
11 sm <- allreduce(n, op='sum')
12 comm.print(sm, all.rank=T)
13
14 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 3_gt.r
```

Sample Output:

```

1 COMM.RANK = 0
2 [1] 2 8
3 COMM.RANK = 0
4 [1] 10
5 COMM.RANK = 1
6 [1] 10

```

Quick Example 4

Broadcast: 4_bcast.r

```

1 library(pbdMPI, quiet=T)
2 init()
3
4 if (comm.rank()==0){
5   x <- matrix(1:4, nrow=2)
6 } else {
7   x <- NULL
8 }
9
10 y <- bcast(x, rank.source=0)
11
12 comm.print(y, rank=1)
13
14 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 4_bcast.r
```

Sample Output:

```

1 COMM.RANK = 1
2   [,1] [,2]
3 [1,]   1   3
4 [2,]   2   4

```

MPI Package Controls

The `.SPMD.CT` object allows for setting different package options with **pbdbMPI**. See the entry *SPMD Control* of the **pbdbMPI** manual for information about the `.SPMD.CT` object:

<http://cran.r-project.org/web/packages/pbdbMPI/pbdbMPI.pdf>

Quick Example 5

Barrier: 5_barrier.r

```

1 library(pbdMPI, quiet = TRUE)
2 init()
3
4 .SPMD.CT$msg.barrier <- TRUE
5 .SPMD.CT$print.quiet <- TRUE
6
7 for (rank in 1:comm.size()-1){
8   if (comm.rank() == rank){
9     cat(paste("Hello", rank+1, "of", comm.size(), "\n"))
10  }
11  barrier()
12 }
13
14 comm.cat("\n")
15
16 comm.cat(paste("Hello", comm.rank()+1, "of",
17               comm.size(), "\n"), all.rank=TRUE)
18 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 5_barrier.r
```

Sample Output:

```

1 Hello 1 of 2
2 Hello 2 of 2

```

Random Seeds

pbdMPI offers a simple interface for managing random seeds:

- `comm.set.seed(diff=TRUE)` — Independent streams via the **rlecuyer** package.
- `comm.set.seed(seed=1234, diff=FALSE)` — All processors use the same seed `seed=1234`
- `comm.set.seed(diff=FALSE)` — All processors use the same seed, determined by processor 0 (using the system clock and PID of processor 0).

Other pbdMPI Tools

Quick Example 6

Timing: 6_timer.r

```

1 library(pbdMPI, quiet=TRUE)
2 init()
3
4 comm.set.seed(diff=T)
5
6 test <- function(timed)
7 {
8   ltime <- system.time(timed)[3]
9
10  mintime <- allreduce(ltime, op='min')
11  maxtime <- allreduce(ltime, op='max')
12  meantime <- allreduce(ltime, op='sum')/comm.size()
13
14  return(data.frame(min=mintime, mean=meantime,
15                    max=maxtime))
16 }
17 times <- test(rnorm(1e6)) # ~7.6MiB of data
18 comm.print(times)
19
20 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 6_timer.r
```

Sample Output:

```

1      min  mean  max
2 1  0.17  0.173  0.176

```

Other Helper Tools

pbdB Also contains useful tools for Manager/Worker and task parallelism codes:

- **Task Subsetting:** Distributing a list of jobs/tasks
get.jid(n)
- ***ply:** Functions in the *ply family.
pbdBApply(X, MARGIN, FUN, ...) — analogue of apply()
pbdBLapply(X, FUN, ...) — analogue of lapply()
pbdBsapply(X, FUN, ...) — analogue of sapply()

Quick Comments for Using pbdMPI

- 1 Start by loading the package:

```
1 library(pbdMPI, quiet = TRUE)
```

- 2 Always initialize before starting and finalize when finished:

```

1 init()
2
3 # ...
4
5 finalize()

```

The GBD Data Structure

Throughout the examples, we will make use of the Generalized Block Distribution, or GBD distributed matrix structure.

- 1 GBD is *distributed*. No processor owns all the data.
- 2 GBD is *non-overlapping*. Rows uniquely assigned to processors.
- 3 GBD is *row-contiguous*. If a processor owns one element of a row, it owns the entire row.
- 4 GBD is globally *row-major*, locally *column-major*.
- 5 GBD is often *locally balanced*, where each processor owns (almost) the same amount of data. But this is not required.
- 6 The last row of the local storage of a processor is adjacent (by global row) to the first row of the local storage of next processor (by communicator number) that owns data.
- 7 GBD is (relatively) easy to understand, but can lead to bottlenecks if you have many more columns than rows.

X _{1,1}	X _{1,2}	X _{1,3}
X _{2,1}	X _{2,2}	X _{2,3}
X _{3,1}	X _{3,2}	X _{3,3}
X _{4,1}	X _{4,2}	X _{4,3}
X _{5,1}	X _{5,2}	X _{5,3}
X _{6,1}	X _{6,2}	X _{6,3}

Quick Comment for GBD

Local pieces of GBD distributed objects will be given the suffix `.gbd` to visually help distinguish them from global objects. This suffix carries no semantic meaning.

pbdMPI Example: Monte Carlo Simulation

Example 1: Monte Carlo Simulation

Sample N uniform observations (x_i, y_i) in the unit square $[0, 1] \times [0, 1]$. Then

$$\pi \approx 4 \left(\frac{\# \text{ Inside Circle}}{\# \text{ Total}} \right) = 4 \left(\frac{\# \text{ Blue}}{\# \text{ Blue} + \# \text{ Red}} \right)$$

Example 1: Monte Carlo Simulation GBD Algorithm

- 1 Let n be big-ish; we'll take $n = 50,000$.
- 2 Generate an $n \times 2$ matrix x of standard uniform observations.
- 3 Count the number of rows satisfying $x^2 + y^2 \leq 1$
- 4 Ask everyone else what their answer is; sum it all up.
- 5 Take this new answer, multiply by 4 and divide by n
- 6 If my rank is 0, print the result.

Example 1: Monte Carlo Simulation Code

Serial Code

```

1 N <- 50000
2 X <- matrix(runif(N * 2), ncol=2)
3 r <- sum(rowSums(X^2) <= 1)
4 PI <- 4*r/N
5 print(PI)

```

Parallel Code

```

1 library(pbdMPI, quiet = TRUE)
2 init()
3 comm.set.seed(diff=TRUE)
4
5 N.gbd <- 50000 / comm.size()
6 X.gbd <- matrix(runif(N.gbd * 2), ncol = 2)
7 r.gbd <- sum(rowSums(X.gbd^2) <= 1)
8 r <- allreduce(r.gbd)
9 PI <- 4*r/(N.gbd * comm.size())
10 comm.print(PI)
11
12 finalize()

```

Note

For the remainder, we will exclude loading, init, and finalize calls.

Example 2: Sample Covariance

$$\text{cov}(x_{n \times p}) = \frac{1}{n-1} \sum_{i=1}^n (x_i - \mu_x)(x_i - \mu_x)^T$$

Example 2: Sample Covariance GBD Algorithm

- 1 Determine the total number of rows N .
- 2 Compute the vector of column means of the full matrix.
- 3 Subtract each column's mean from that column's entries in each local matrix.
- 4 Compute the crossproduct locally and reduce.
- 5 Divide by $N - 1$.

Example 2: Sample Covariance Code

Serial Code

```

1 N <- nrow(X)
2 mu <- colSums(X) / N
3
4 X <- sweep(X, STATS=mu, MARGIN=2)
5 Cov.X <- crossprod(X) / (N-1)
6
7 print(Cov.X)

```

Parallel Code

```

1 N <- allreduce(nrow(X.gbd), op="sum")
2 mu <- allreduce(colSums(X.gbd) / N, op="sum")
3
4 X.gbd <- sweep(X.gbd, STATS=mu, MARGIN=2)
5 Cov.X <- allreduce(crossprod(X.gbd), op="sum") / (N-1)
6
7 comm.print(Cov.X)

```

Example 3: Linear Regression

Find β such that

$$\mathbf{y} = \mathbf{X}\beta + \epsilon$$

When \mathbf{X} is full rank,

$$\hat{\beta} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

Example 3: Linear Regression GBD Algorithm

- 1 Locally, compute $tx = x^T$
- 2 Locally, compute $A = tx * x$. Query every other processor for this result and sum up all the results.
- 3 Locally, compute $B = tx * y$. Query every other processor for this result and sum up all the results.
- 4 Locally, compute $A^{-1} * B$

Example 3: Linear Regression Code

Serial Code

```

1 tX <- t(X)
2 A <- tX %*% X
3 B <- tX %*% y
4
5 ols <- solve(A) %*% B

```

Parallel Code

```

1 tX.gbd <- t(X.gbd)
2 A <- allreduce(tX.gbd %*% X.gbd, op = "sum")
3 B <- allreduce(tX.gbd %*% y.gbd, op = "sum")
4
5 ols <- solve(A) %*% B

```

Introduction to Distributed Matrices

Distributed Matrices

High level OOP allows *native* serial R syntax:

```
1 x <- x[-1, 2:5]
2 x <- log(abs(x) + 1)
3 xtx <- t(x) %*% x
4 ans <- svd(solve(xtx))
```

However...

Distributed Matrices

DMAT:

- Distributed **MAT**rix data structure.
- No single processor should hold all of the data.
- Block-cyclic matrix distributed across a 2-dimensional grid of processors.
- Very robust, but confusing data structure.

Distributed Matrices

$$\begin{bmatrix} 0 & 1 & 2 \\ 3 & 4 & 5 \end{bmatrix}$$

(b) 2×3

$$\begin{bmatrix} 0 & 1 \\ 2 & 3 \\ 4 & 5 \end{bmatrix}$$

(c) 3×2

$$\begin{bmatrix} 0 \\ 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{bmatrix}$$

(d) 6×1

Table : Processor Grid Shapes with 6 Processors

Distributed Matrices

The data structure is a special R class (in the OOP sense) called `ddmatrix`. It is the “under the rug” storage for a block-cyclic matrix distributed onto a 2-dimensional processor grid.

$$\text{ddmatrix} = \left\{ \begin{array}{ll} \text{Data} & \text{S4 local submatrix, an R matrix} \\ \text{dim} & \text{S4 dimension of the global matrix, a numeric pair} \\ \text{ldim} & \text{S4 dimension of the local submatrix, a numeric pair} \\ \text{bldim} & \text{S4 ScaLAPACK blocking factor, a numeric pair} \\ \text{CTXT} & \text{S4 BLACS context, an numeric singleton} \end{array} \right.$$

with prototype

$$\text{new("ddmatrix")} = \left\{ \begin{array}{ll} \text{Data} & = \text{matrix}(0.0) \\ \text{dim} & = \text{c}(1,1) \\ \text{ldim} & = \text{c}(1,1) \\ \text{bldim} & = \text{c}(1,1) \\ \text{CTXT} & = 0.0 \end{array} \right.$$

Distributed Matrices: The Data Structure

Example: an 9×9 matrix is distributed with a “block-cycling” factor of 2×2 on a 2×2 processor grid:

$$= \left\{ \begin{array}{ll} \text{Data} & = \text{matrix}(\dots) \\ \text{dim} & = \text{c}(9, 9) \\ \text{ldim} & = \text{c}(\dots) \\ \text{bldim} & = \text{c}(2, 2) \\ \text{CTXT} & = 0 \end{array} \right.$$

See <http://acts.nersc.gov/scalapack/hands-on/datadist.html>

Understanding Dmat: Global Matrix

$$X = \begin{bmatrix} X_{11} & X_{12} & X_{13} & X_{14} & X_{15} & X_{16} & X_{17} & X_{18} & X_{19} \\ X_{21} & X_{22} & X_{23} & X_{24} & X_{25} & X_{26} & X_{27} & X_{28} & X_{29} \\ X_{31} & X_{32} & X_{33} & X_{34} & X_{35} & X_{36} & X_{37} & X_{38} & X_{39} \\ X_{41} & X_{42} & X_{43} & X_{44} & X_{45} & X_{46} & X_{47} & X_{48} & X_{49} \\ X_{51} & X_{52} & X_{53} & X_{54} & X_{55} & X_{56} & X_{57} & X_{58} & X_{59} \\ X_{61} & X_{62} & X_{63} & X_{64} & X_{65} & X_{66} & X_{67} & X_{68} & X_{69} \\ X_{71} & X_{72} & X_{73} & X_{74} & X_{75} & X_{76} & X_{77} & X_{78} & X_{79} \\ X_{81} & X_{82} & X_{83} & X_{84} & X_{85} & X_{86} & X_{87} & X_{88} & X_{89} \\ X_{91} & X_{92} & X_{93} & X_{94} & X_{95} & X_{96} & X_{97} & X_{98} & X_{99} \end{bmatrix}_{9 \times 9}$$

Understanding DMAT: Local View

$$\text{Processor grid} = \begin{vmatrix} 0 & 1 & 2 \\ 3 & 4 & 5 \end{vmatrix} = \begin{vmatrix} (0,0) & (0,1) & (0,2) \\ (1,0) & (1,1) & (1,2) \end{vmatrix}$$

The DMAT Data Structure

- DMAT is *distributed*. No one processor owns all of the matrix.
- DMAT is *non-overlapping*. Any piece owned by one processor is owned by no other processors.
- DMAT can be row-contiguous or not, depending on the processor grid and blocking factor used.
- DMAT is locally column-major and globally, it depends. . .
- GBD is a generalization of the one-dimensional block DMAT distribution. Otherwise there is no relation.
- DMAT is confusing, but very robust.

X ₁₁	X ₁₂	X ₁₃	X ₁₄	X ₁₅
X ₂₁	X ₂₂	X ₂₃	X ₂₄	X ₂₅
X ₃₁	X ₃₂	X ₃₃	X ₃₄	X ₃₅
X ₄₁	X ₄₂	X ₄₃	X ₄₄	X ₄₅

Pros and Cons of This Data Structure

Pros

- Fast for distributed matrix computations

Cons

- Literally everything else

This is why we hide most of the distributed details.

The details are there if you want them (you don't want them).

Distributed Matrix Methods

pbdDMAT has over 100 methods with *identical* syntax to R:

- ``[, rbind(), cbind(), ...`
- `lm.fit(), prcomp(), cov(), ...`
- ``*%`, solve(), svd(), norm(), ...`
- `median(), mean(), rowSums(), ...`

Serial Code

```
1 cov(x)
```

Parallel Code

```
1 cov(x)
```

Comparing pbdMPI and pbdDMAT

pbdMPI:

- MPI + sugar.
- GBD not the only structure **pbdMPI** can handle (just a useful convention).

pbdDMAT:

- More of a software package.
- DMAT structure *must* be used for **pbdDMAT**.
- If the data is not 2d block-cyclic compatible, DMAT will *definitely* give the wrong answer.

Quick Comments for Using pbdDMAT

- 1 Start by loading the package:

```
1 library(pbdDMAT, quiet = TRUE)
```

- 2 Always initialize before starting and finalize when finished:

```
1 init.grid()
2
3 # ...
4
5 finalize()
```

- 3 Distributed DMAT objects will be given the suffix `.dmat` to visually help distinguish them from global objects. This suffix carries no semantic meaning.

Contents

 - Manipulating DMAT Objects
 - Statistics Examples with pbdDMAT
 - RandSVD

Manipulating DMAT Objects

Example 1: DMAT Construction

Generate a global matrix and distribute it

```

1 library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
4 # Common global on all processors --> distributed
5 x <- matrix(1:100, nrow=10, ncol=10)
6 x.dmat <- as.ddmatrix(x)
7
8 x.dmat
9
10 # Global on processor 0 --> distributed
11 if (comm.rank()==0){
12   y <- matrix(1:100, nrow=10, ncol=10)
13 } else {
14   y <- NULL
15 }
16 y.dmat <- as.ddmatrix(y)
17
18 y.dmat
19
20 finalize()
```

Execute this script via:

```
1 mpirun -np 2 Rscript 1_gen.r
```

Example 2: DMAT Construction

Generate locally only what is needed

```

1 library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
4 zero.dmat <- ddmatrix(0, nrow=100, ncol=100)
5 zero.dmat
6
7 id.dmat <- diag(1, nrow=100, ncol=100, type="ddmatrix")
8 id.dmat
9
10 comm.set.seed(diff=T)
11 rand.dmat <- ddmatrix("rnorm", nrow=100, ncol=100,
12                       mean=10, sd=100)
13 rand.dmat
14 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 2_gen.r
```

Example 3: DMAT Operations

Generate locally only what is needed

```

1 library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
4 x.dmat <- ddmatrix(1:30, nrow=10)
5 y.dmat <- x.dmat[c(1, 3, 5, 7, 9), -3]
6
7 comm.print(y.dmat)
8 y <- as.matrix(y.dmat)
9 comm.print(y)
10
11 finalize()

```

Execute this script via:

```
1 mpirun -np 2 Rscript 3_extract.r
```

Manipulating DMAT Objects

Example 4: More DMAT Operations

```

1 library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
4 x.dmat <- ddmatrix(1:30, nrow=10)
5
6 y.dmat <- x.dmat + 1:7
7
8 z.dmat <- scale(x.dmat, center=TRUE, scale=TRUE)
9
10 y <- as.matrix(y.dmat)
11 z <- as.matrix(z.dmat)
12
13 comm.print(y)
14 comm.print(z)
15
16 finalize()

```

Statistics Examples with pbdDMAT

Sample Covariance

Serial Code

```
1 Cov.X <- cov(X)
2 print(Cov.X)
```

Parallel Code

```
1 Cov.X <- cov(X)
2 print(Cov.X)
```

Linear Regression

Serial Code

```

1 tX <- t(X)
2 A <- tX %*% X
3 B <- tX %*% y
4
5 ols <- solve(A) %*% B
6
7 # or
8 ols <- lm.fit(X, y)

```

Parallel Code

```

1 tX <- t(X)
2 A <- tX %*% X
3 B <- tX %*% y
4
5 ols <- solve(A) %*% B
6
7 # or
8 ols <- lm.fit(X, y)

```

Example 5: PCA

PCA: pca.r

```

1 library(pbdDMAT, quiet=T)
2 init.grid()
3
4 n <- 1e4
5 p <- 250
6
7 comm.set.seed(diff=T)
8 x.dmat <- ddmatrix("rnorm", nrow=n, ncol=p, mean=100, sd=25)
9
10 pca <- prcomp(x=x.dmat, retx=TRUE, scale=TRUE)
11 prop_var <- cumsum(pca$sdev)/sum(pca$sdev)
12 i <- max(min(which(prop_var > 0.9)) - 1, 1)
13
14 y.dmat <- pca$x[, 1:i]
15
16 comm.cat("\nCols: ", i, "\n", quiet=T)
17 comm.cat("%Cols: ", i/dim(x.dmat)[2], "\n\n", quiet=T)
18
19 finalize()

```

Execute this script via:

Sample Output:

```
1 mpirun -np 2 Rscript 5_pca.r
```

```

1 Cols: 221
2 %Cols: 0.884

```

Distributed Matrices

pbdDEMO contains many other examples of reading and managing GBD and DMAT data

Randomized SVD¹

PROTOTYPE FOR RANDOMIZED SVD

Given an $m \times n$ matrix A , a target number k of singular vectors, and an exponent q (say, $q = 1$ or $q = 2$), this procedure computes an approximate rank- $2k$ factorization $U\Sigma V^*$, where U and V are orthonormal, and Σ is nonnegative and diagonal.

Stage A:

- 1 Generate an $n \times 2k$ Gaussian test matrix Ω .
- 2 Form $Y = (AA^*)^q A\Omega$ by multiplying alternately with A and A^* .
- 3 Construct a matrix Q whose columns form an orthonormal basis for the range of Y .

Stage B:

- 4 Form $B = Q^* A$.
- 5 Compute an SVD of the small matrix: $B = \tilde{U}\Sigma V^*$.
- 6 Set $U = Q\tilde{U}$.

Note: The computation of Y in step 2 is vulnerable to round-off errors. When high accuracy is required, we must incorporate an orthonormalization step between each application of A and A^* ; see Algorithm 4.4.

ALGORITHM 4.4: RANDOMIZED SUBSPACE ITERATION

Given an $m \times n$ matrix A and integers ℓ and q , this algorithm computes an $m \times \ell$ orthonormal matrix Q whose range approximates the range of A .

- 1 Draw an $n \times \ell$ standard Gaussian matrix Ω .
- 2 Form $Y_0 = A\Omega$ and compute its QR factorization $Y_0 = Q_0 R_0$.
- 3 for $j = 1, 2, \dots, q$
- 4 Form $\tilde{Y}_j = A^* Q_{j-1}$ and compute its QR factorization $\tilde{Y}_j = \tilde{Q}_j \tilde{R}_j$.
- 5 Form $Y_j = A\tilde{Q}_j$ and compute its QR factorization $Y_j = Q_j R_j$.
- 6 end
- 7 $Q = Q_q$.

Serial R

```

1 randSVD <- function(A, k, q=3)
2 {
3   ## Stage A
4   Omega <- matrix(rnorm(n*2*k),
5     nrow=n, ncol=2*k)
6   Y <- A %*% Omega
7   Q <- qr.Q(qr(Y))
8   At <- t(A)
9   for(i in 1:q)
10    {
11      Y <- At %*% Q
12      Q <- qr.Q(qr(Y))
13      Y <- A %*% Q
14      Q <- qr.Q(qr(Y))
15    }
16
17   ## Stage B
18   B <- t(Q) %*% A
19   U <- La.svd(B)$u
20   U <- Q %*% U
21   U[, 1:k]
22 }
```

RandSVD

Randomized SVD

Serial R

```

1 randSVD <- function(A, k, q=3)
2   {
3     ## Stage A
4     Omega <- matrix(rnorm(n*2*k),
5                     nrow=n, ncol=2*k)
6     Y <- A %*% Omega
7     Q <- qr.Q(qr(Y))
8     At <- t(A)
9     for(i in 1:q)
10      {
11        Y <- At %*% Q
12        Q <- qr.Q(qr(Y))
13        Y <- A %*% Q
14        Q <- qr.Q(qr(Y))
15      }
16
17     ## Stage B
18     B <- t(Q) %*% A
19     U <- La.svd(B)$u
20     U <- Q %*% U
21     U[, 1:k]
22   }

```

Parallel pbdR

```

1 randSVD <- function(A, k, q=3)
2   {
3     ## Stage A
4     Omega <- ddmatrix("rnorm",
5                     nrow=n, ncol=2*k)
6     Y <- A %*% Omega
7     Q <- qr.Q(qr(Y))
8     At <- t(A)
9     for(i in 1:q)
10      {
11        Y <- At %*% Q
12        Q <- qr.Q(qr(Y))
13        Y <- A %*% Q
14        Q <- qr.Q(qr(Y))
15      }
16
17     ## Stage B
18     B <- t(Q) %*% A
19     U <- La.svd(B)$u
20     U <- Q %*% U
21     U[, 1:k]
22   }

```
