Affiliations and Support

The pbdR Core Team http://r-pbd.org

Wei-Chen Chen¹, George Ostrouchov^{1,2}, Pragneshkumar Patel², Drew Schmidt¹

Ostrouchov, Patel, and Schmidt were supported in part by the project "NICS Remote Data Analysis and Visualization Center" funded by the Office of Cyberinfrastructure of the U.S. National Science Foundation under Award No. ARRA-NSF-OCI-0906324 for NICS-RDAV center.

Chen and Ostrouchov were supported in part by the project "Visual Data Exploration and Analysis of Ultra-large Climate Data" funded by U.S. DOE Office of Science under Contract No. DE-AC05-00OR22725.

¹ Computer Science and Mathematics Division, Oak Ridge National Laboratory, Oak Ridge, TN 2

About This Presentation

Speaking Serial R with a Parallel Accent

The content of this presentation is based in part on the **pbdDEMO** vignette *Speaking Serial R with a Parallel Accent*

http://goo.gl/HZkRt

It contains more examples, and sometimes added detail.

About This Presentation

Conventions For Code Presentation

We will use two different forms of syntax highlighting. One for displaying results from an interactive R session:

```
1 R> "interactive"
2 [1] "interactive"
```

and one for presenting R scripts

```
1 "not interactive"
```

- Introduction to R
 - What is R?
 - Basic Numerical Operations in R
 - R Syntax for Data Science: Not A Matlab Clone!

What is R?

What is R?

- lingua franca for data analytics and statistical computing.
- Part programming language, part data analysis package.
- Dialect of S (Bell Labs).
- Syntax designed for data.

Wrapup

Who uses R?

Google, Pfizer, Merck, Bank of America, Shell^a, Oracle^b, Facebook, bing, Mozilla, okcupid^c, ebay^d, kickstarter^e, the New York Times^f

What is R?

What is R?

Data Types

- Storage: logical, int, double, double complex, character
- Structures: vector, matrix, array, list, dataframe
- Caveats: (Logical) TRUE, FALSE, NA

For the remainder of the tutorial, we will restrict ourselves to real number matrix computations.

Basics (1 of 2)

• The default method is to print:

```
R> sum
2 function (..., na.rm = FALSE) .Primitive("sum")
```

Use <- for assignment:</p>

```
R> x <- 1
2 R> x+1
  [1] 2
```

- Naming rules: mostly like C.
- R is case sensitive.
- We use . the way most languages use _, e.g., La.svd() instead of La svd().
- We use \$ (sometimes @) the way most languages use .

What is R?

Basics (2 of 2)

• Use ? or ?? to search help

```
1 R> ?set.seed
```

- 2 R> ?comm.set.seed
- No documentation for comm.set.seed in specified packages and libraries:
- 4 you could try ??comm.set.seed
- 5 R> ??comm.set.seed

Addons and Extras

R has the Comprehensive R Archive Network (CRAN), which is a package repository like CTAN and CPAN.

From R

```
install.packages("pbdMPI") # install
library(pbdMPI) # load
```

From Shell

```
1 R CMD INSTALL pbdMPI_0.1-6.tar.gz
```

Basic Numerical Operations in R

```
Lists (1 of 1)
```

```
R>
         <- list(a=1, b="a")
2
  R> 1
  $a
   [1] 1
5
6
7
  $b
   [1] "a"
8
  R> 1$a
   [1] 1
10
11
12
  R> list(x=list(a=1, b="a"), y=TRUE)
13
  $x
  $x$a
14
   [1] 1
15
16
17
  $x$b
   [1] "a"
18
19
20
21
  $ v
   [1]
       TRUE
```

Intro to R

0000000

Vectors and Matrices (1 of 2)

```
R > c(1, 2, 3, 4, 5, 6)
   [1] 1 2 3 4 5 6
3
  R > matrix(1:6, nrow=2, ncol=3)
        [,1] [,2] [,3]
   [1,]
7
   [2,]
8
  R > x < -matrix(1:6, nrow=2, ncol=3)
10
  R > x[, -1]
11
        [,1] [,2]
12
  [1,]
13
   [2,]
14
15
  R > x[1, 1:2]
16
   [1] 1 3
17
```

Basic Numerical Operations in R

Vectors and Matrices (2 of 2)

```
R> dim(x)
   [1] 2 3
3
  R> dim(x) <- NULL
  R> x
   [1] 1 2 3 4 5 6
7
  R > dim(x) < -c(3,2)
9
  R> x
         [,1] [,2]
10
   [1,]
11
   [2,]
12
                  5
   [3,]
            3
                  6
13
```

Basic Numerical Operations in R

Vector and Matrix Arithmetic (1 of 2)

```
R > 1:4 + 4:1
   [1] 5 5 5 5
3
  R > x < -matrix(0, nrow=2, ncol=3)
  R> x
         [,1] [,2] [,3]
8
   [1,]
   [2,]
10
  R > x + 1:3
11
         [,1] [,2]
                    [,3]
12
   [1,]
13
   [2,]
                        3
14
```

Vector and Matrix Arithmetic (2 of 2)

```
R> x <- matrix(1:6, nrow=2)
  R> x*x
         [,1]
              [,2] [,3]
   [1,]
                       25
6
7
   [2,]
                 16
                       36
  R> x %*% x
  Error in x %*% x : non-conformable arguments
10
11
  R> t(x) %*% x
         [,1] [,2]
                     [,3]

```

•00000

More than just a Matlab clone...

- Data science (machine learning, statistics, data mining, ...) is mostly matrix algebra.
 - So what about Matlab/Python/Julia/...?
- The one you prefer depends more on your "religion" rather than differences in capabilities.
- As a data analysis package, R is king.

000000

Simple Statistics (1 of 2): Summary Statistics

```
R > x < -matrix(rnorm(30, mean=10, sd=3), nrow=10)
  R> mean(x)
   [1] 9.825177
  R> median(x)
   [1] 9.919243
8
  R> sd(as.vector(x))
  [1] 3.239388
10
11
  R> colMeans(x)
12
        9.661822 10.654686 9.159025
13
  [1]
14
  R> apply(x, MARGIN=2, FUN=sd)
15
  [1] 2.101059 3.377347 4.087131
16
```

000000

Simple Statistics (2 of 2): Sample Covariance

$$cov(x_{n \times p}) = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \mu_x) (x_i - \mu_x)^T$$

```
1  x <- matrix(rnorm(30), nrow=10)
2  # least recommended
4  cm <- colMeans(x)
5  crossprod(sweep(x, MARGIN=2, STATS=cm))
6  # less recommended
8  crossprod(scale(x, center=TRUE, scale=FALSE))
9  # recommended
11  cov(x)</pre>
```

R Syntax for Data Science: Not A Matlab Clone!

000000

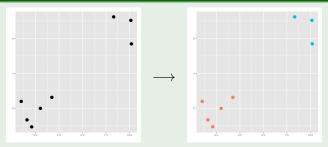

Advanced Statistics (1 of 2): Principal Components

PCA = centering + scaling + rotation (via SVD)

```
R > x < - matrix(rnorm(30), nrow=10)
2
  R> prcomp(x, retx=TRUE, scale=TRUE)
  Standard deviations:
  [1] 1.1203373 1.0617440 0.7858397
6
  Rotation:
                PC1
                            PC2
                                        PC3
8
  [1.]
        0.71697825 -0.3275365
                                 0.6153552
       -0.03382385 0.8653562
                                 0.5000147
  [2,]
10
  [3,]
        0.69627447
                     0.3793133 -0.6093630
11
```

000000

```
1 R> x <- rbind(matrix(rnorm(5*2, mean=0), ncol=2),
matrix(rnorm(3*2, mean=10), ncol=2))
```

000000

Advanced Statistics (2 of 2): k-Means Clustering

```
R> kmeans(x, centers=2)
  K-means clustering with 2 clusters of sizes 5. 3
3
  Cluster means:
           [,1]
                      [,2]
5
  1 -0.1080612 -0.2827576
  2 9.5695365 9.3191892
8
  Clustering vector:
  [1] 1 1 1 1 1 2 2 2
10
11
  Within cluster sum of squares by cluster:
12
  [1] 14.675072 7.912641
13
   (between SS / total SS = 93.9 %)
14
15
16
  Available components:
17
  [1] "cluster"
                     "centers"
                                      "totss"
18
      "withinss"
                      "tot.withinss"
  [6] "betweenss"
                      "size"
19
```

The pbdR Project

Programming with Big Data in R (pbdR)

Striving for Productivity, Portability, Performance

- Free^a R packages.
- Bridging high-performance C with high-productivity of R
- Scalable, big data analytics.
- Distributed data details implicitly managed.
- Methods have syntax identical to R.
- Powered by state of the art numerical libraries (MPI, ScaLAPACK, . . .)

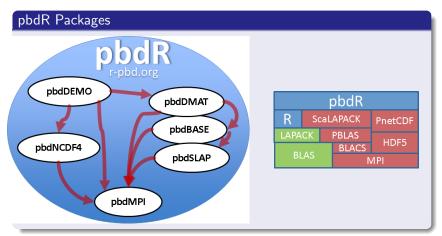

^aMPL, BSD, and GPL licensed

The pbdR Project

Example Syntax

```
1 x <- x[-1, 2:5]

2 x <- log(abs(x) + 1)

3 xtx <- t(x) %*% x

4 ans <- svd(solve(xtx))
```

Look familiar?

The above runs on 1 core with R or 10,000 cores with pbdR

The pbdR Project

Least Squares Benchmark

pbdR Paradigms

pbdR Paradigms

Programs that use pbdR utilize:

- Batch execution
- Single Program/Multiple Data (SPMD) style

And generally utilize:

Data Parallelism

Batch Execution

- Non-interactive
- Use

```
Rscript my_script.r
```

or

1 R CMD BATCH my_script.r

In parallel:

```
1 mpirun -np 2 Rscript my_par_script.r
```

Single Program/Multiple Data (SPMD)

- Difficult to describe, easy to do...
- Only one program is written, executed in batch on all processors.
- Different processors are autonomous; there is no manager.
- The dominant programming model for large machines.

- Introduction to pbdMPI
 - Managing a Communicator
 - Reduce, Gather, Broadcast, and Barrier
 - Other pbdMPI Tools

Message Passing Interface (MPI)

- MPI: Standard for managing communications (data and instructions) between different nodes/computers.
- Implementations: OpenMPI, MPICH2, Cray MPT, ...
- Enables parallelism (via communication) on distributed machines.
- Communicator: manages communications between processors.

The operations (1 or 2)

 Managing a Communicator: Create and destroy communicators.

init() — initialize communicator
finalize() — shut down communicator(s)

 Rank query: determine the processor's position in the communicator.

```
comm.rank() — "who am I?"
comm.size() — "how many of us are there?"
```

• **Printing**: Printing output from various ranks.

```
comm.print(x)
comm.cat(x)
```

WARNING: only use these functions on *results*, never on yet-to-be-computed things.

Managing a Communicator

Quick Example 1

Rank Query: 1_rank.r

```
library(pbdMPI, quiet = TRUE)
  init()
3
  my.rank <- comm.rank()</pre>
  comm.print(my.rank, all.rank=TRUE)
6
  finalize()
```

Execute this script via:

```
COMM \cdot RANK = O
mpirun -np 2 Rscript 1_rank.r
                                              [1] 0
                                           2
                                             COMM.RANK = 1
                                              [1] 1
```

Sample Output:

Managing a Communicator

Quick Example 2

Hello World: 2_hello.r

```
library(pbdMPI, quiet=TRUE)
init()

comm.print("Hello, world")

comm.print("Hello again", all.rank=TRUE, quiet=TRUE)

finalize()
```

Execute this script via:

mpirun -np 2 Rscript 2_hello.r

```
COMM.RANK = 0
[1] "Hello, world"
3 [1] "Hello again"
```

Sample Output:

"Hello again"

[1]

Reduce, Gather, Broadcast, and Barrier

Reduce, Gather, Broadcast, and Barrier

Barrier — Synchronization Barrier Barrier Barrier

Reduce, Gather, Broadcast, and Barrier

MPI Operations (2 of 2)

- Reduction: each processor has a number x; add all of them up, find the largest/smallest,
 reduce(x, op='sum') reduce to one allreduce(x, op='sum') reduce to all
- **Gather**: each processor has a number; create a new object on some processor containing all of those numbers. gather(x) gather to one allgather(x) gather to all
- Broadcast: one processor has a number x that every other processor should also have.
 bcast(x)
- Barrier: "computation wall"; no processor can proceed until all processors can proceed.
 barrier()

Other pbdMPI Tools

Random Seeds

00000

pbdMPI offers a simple interface for managing random seeds:

- comm.set.seed(diff=TRUE) Independent streams via the rlecuyer package.
- comm.set.seed(seed=1234, diff=FALSE) All processors use the same seed seed=1234
- comm.set.seed(diff=FALSE) All processors use the same seed, determined by processor 0 (using the system clock and PID of processor 0).

pbdMPI Also contains useful tools for Manager/Worker and task parallelism codes:

- Task Subsetting: Distributing a list of jobs/tasks get.jid(n)
- *ply: Functions in the *ply family.
 pbdApply(X, MARGIN, FUN, ...) analogue of apply()
 pbdLapply(X, FUN, ...) analogue of lapply()
 pbdSapply(X, FUN, ...) analogue of sapply()

Other pbdMPI Tools

Quick Comments for Using pbdMPI

00000

Start by loading the package:

```
1 library(pbdMPI, quiet = TRUE)
```

② Always initialize before starting and finalize when finished:

```
init()

;

;

;

;

;

finalize()
```

Other pbdMPI Tools

Basic MPI Exercises

• Experiment with Quick Examples 1 through 6, running them on 2, 4, and 8 processors.

The GBD Data Structure

Distributing a Matrix Across 4 Processors: Block Distribution

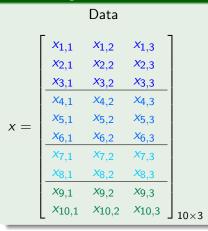

Processors

The GBD Data Structure

Distributing a Matrix Across 4 Processors: Local Load Balance

Processors

The GBD Data Structure

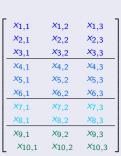

The GBD Data Structure

Throughout the examples, we will make use of the Generalized Block Distribution, or GBD distributed matrix structure.

- GBD is distributed. No processor owns all the data.
- ② GBD is non-overlapping. Rows uniquely assigned to processors.
- (3) GBD is *row-contiguous*. If a processor owns one element of a row, it owns the entire row.
- 4 GBD is globally row-major, locally column-major.
- GBD is often locally balanced, where each processor owns (almost) the same amount of data. But this is not required.

0	The last row of the local storage of a processor is adjacent (by global row) to
	the first row of the local storage of next processor (by communicator number)
	that owns data.

GBD is (relatively) easy to understand, but can lead to bottlenecks if you have many more columns than rows.

GBD: Example 1

Understanding GBD: Global Matrix

$$x = \begin{bmatrix} x_{11} & x_{12} & x_{13} & x_{14} & x_{15} & x_{16} & x_{17} & x_{18} & x_{19} \\ x_{21} & x_{22} & x_{23} & x_{24} & x_{25} & x_{26} & x_{27} & x_{28} & x_{29} \\ x_{31} & x_{32} & x_{33} & x_{34} & x_{35} & x_{36} & x_{37} & x_{38} & x_{39} \\ x_{41} & x_{42} & x_{43} & x_{44} & x_{45} & x_{46} & x_{47} & x_{48} & x_{49} \\ x_{51} & x_{52} & x_{53} & x_{54} & x_{55} & x_{56} & x_{57} & x_{58} & x_{59} \\ x_{61} & x_{62} & x_{63} & x_{64} & x_{65} & x_{66} & x_{67} & x_{68} & x_{69} \\ x_{71} & x_{72} & x_{73} & x_{74} & x_{75} & x_{76} & x_{77} & x_{78} & x_{79} \\ x_{81} & x_{82} & x_{83} & x_{84} & x_{85} & x_{86} & x_{87} & x_{88} & x_{89} \\ x_{91} & x_{92} & x_{93} & x_{94} & x_{95} & x_{96} & x_{97} & x_{98} & x_{99} \end{bmatrix}$$

GBD: Example 1

Understanding GBD: Load Balanced GBD

$$X = \begin{bmatrix} X_{11} & X_{12} & X_{13} & X_{14} & X_{15} & X_{16} & X_{17} & X_{18} & X_{19} \\ X_{21} & X_{22} & X_{23} & X_{24} & X_{25} & X_{26} & X_{27} & X_{28} & X_{29} \\ X_{31} & X_{32} & X_{33} & X_{34} & X_{35} & X_{36} & X_{37} & X_{38} & X_{39} \\ X_{41} & X_{42} & X_{43} & X_{44} & X_{45} & X_{46} & X_{47} & X_{48} & X_{49} \\ X_{51} & X_{52} & X_{53} & X_{54} & X_{55} & X_{56} & X_{57} & X_{58} & X_{59} \\ X_{61} & X_{62} & X_{63} & X_{64} & X_{65} & X_{66} & X_{67} & X_{68} & X_{69} \\ X_{71} & X_{72} & X_{73} & X_{74} & X_{75} & X_{76} & X_{77} & X_{78} & X_{79} \\ X_{81} & X_{82} & X_{83} & X_{84} & X_{85} & X_{86} & X_{87} & X_{88} & X_{89} \\ X_{91} & X_{92} & X_{93} & X_{94} & X_{95} & X_{96} & X_{97} & X_{98} & X_{99} \end{bmatrix}$$

Quick Comment for GBD

Local pieces of GBD distributed objects will be given the suffix .gbd to visually help distinguish them from global objects. This suffix carries no semantic meaning.

pbdMPI Example: Monte Carlo Simulation

Example 1: Monte Carlo Simulation

Sample *N* uniform observations (x_i, y_i) in the unit square $[0,1] \times [0,1]$. Then

$$\pi pprox 4\left(rac{\#\ \textit{Inside Circle}}{\#\ \textit{Total}}
ight) = 4\left(rac{\#\ \textit{Blue}}{\#\ \textit{Blue} + \#\ \textit{Red}}
ight)$$

pbdMPI Example: Monte Carlo Simulation

Example 1: Monte Carlo Simulation GBD Algorithm

- Let n be big-ish; we'll take n = 50,000.
- **2** Generate an $n \times 2$ matrix x of standard uniform observations.
- **3** Count the number of rows satisfying $x^2 + y^2 \le 1$
- Ask everyone else what their answer is; sum it all up.
- \odot Take this new answer, multiply by 4 and divide by n
- 1 If my rank is 0, print the result.

pbdMPI Example: Monte Carlo Simulation

Example 1: Monte Carlo Simulation Code

Serial Code

```
1 N <- 50000
2 X <- matrix(runif(N * 2), ncol=2)
3 r <- sum(rowSums(X^2) <= 1)
4 PI <- 4*r/N
5 print(PI)</pre>
```

Parallel Code

```
library(pbdMPI, quiet = TRUE)
init()
comm.set.seed(diff=TRUE)

N.gbd <- 50000 / comm.size()
X.gbd <- matrix(runif(N.gbd * 2), ncol = 2)
r.gbd <- sum(rowSums(X.gbd^2) <= 1)
r <- allreduce(r.gbd)
PI <- 4*r/(N.gbd * comm.size())
comm.print(PI)

finalize()</pre>
```

pbdMPI Example: Sample Covariance

Example 2: Sample Covariance GBD Algorithm

- \bullet Determine the total number of rows N.
- 2 Compute the vector of column means of the full matrix.
- 3 Subtract each column's mean from that column's entries in each local matrix.
- 4 Compute the crossproduct locally and reduce.
- **5** Divide by N-1.

pbdMPI Example: Sample Covariance

Example 2: Sample Covariance Code

Serial Code

```
1 N <- nrow(X)
2 mu <- colSums(X) / N
3
4 X <- sweep(X, STATS=mu, MARGIN=2)
5 Cov.X <- crossprod(X) / (N-1)
6
7 print(Cov.X)</pre>
```

Parallel Code

```
1 N <- allreduce(nrow(X.gbd), op="sum")
2 mu <- allreduce(colSums(X.gbd) / N, op="sum")
3 
4 X.gbd <- sweep(X.gbd, STATS=mu, MARGIN=2)
5 Cov.X <- allreduce(crossprod(X.gbd), op="sum") / (N-1)
6 
7 comm.print(Cov.X)</pre>
```

pbdMPI Example: Linear Regression

Example 3: Linear Regression

Find β such that

$$y = X\beta + \epsilon$$

When **X** is full rank,

$$\hat{\boldsymbol{\beta}} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

pbdMPI Example: Linear Regression

Advanced MPI Exercises I

- Write a script that will have each processor randomly take a sample of size 1 of TRUE and FALSE. Have each processor print its result.
- Modify the script in Exercise 1 above to determine if any processors sampled TRUE. Do the same to determine if all processors sampled TRUE. In each case, print the result. Compare to the functions comm.all() and comm.any().
- **3** Generate 50,000,000 (total) random normal values in parallel on 2, 4, and 8 processors. Time each run.

pbdMPI Example: Linear Regression

Advanced MPI Exercises II

- Obstribute the matrix x <- matrix(1:24, nrow=12) in GBD format across 4 processors and call it x.spmd.
 - Add x.spmd to itself.
 - 2 Compute the mean of x.spmd.
 - 3 Compute the column means of x.spmd.

Introduction to Distributed Matrices

Distributed Matrices

High level OOP allows *native* serial R syntax:

```
1 x <- x[-1, 2:5]

2 x <- log(abs(x) + 1)

3 xtx <- t(x) %*% x

4 ans <- svd(solve(xtx))
```

However. . .

Introduction to Distributed Matrices

Distributed Matrices

DMAT:

- Distributed MATrix data structure.
- No single processor should hold all of the data.
- Block-cyclic matrix distributed across a 2-dimensional grid of processors.
- Very robust, but confusing data structure.

Introduction to Distributed Matrices

Distributed Matrices

The data structure is a special R class (in the OOP sense) called ddmatrix. It is the "under the rug" storage for a block-cyclic matrix distributed onto a 2-dimensional processor grid.

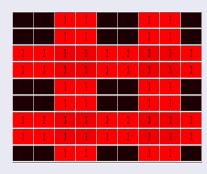

with prototype

```
\label{eq:new("ddmatrix")} \text{new("ddmatrix")} = \begin{cases} \textbf{Data} &= \texttt{matrix}(0.0) \\ \textbf{dim} &= \texttt{c}(1,1) \\ \textbf{ldim} &= \texttt{c}(1,1) \\ \textbf{bldim} &= \texttt{c}(1,1) \\ \textbf{CTXT} &= 0.0 \end{cases}
```

Distributed Matrices: The Data Structure

Example: an 9×9 matrix is distributed with a "block-cycling" factor of 2×2 on a 2×2 processor grid:

$$= \begin{cases} \textbf{Data} &= \texttt{matrix}(\dots) \\ \textbf{dim} &= \texttt{c}(9, 9) \\ \textbf{Idim} &= \texttt{c}(\dots) \\ \textbf{bIdim} &= \texttt{c}(2, 2) \\ \textbf{CTXT} &= 0 \end{cases}$$

pbdDMAT

The DMAT Data Structure

- ① DMAT is distributed. No one processor owns all of the matrix.
- ② DMAT is non-overlapping. Any piece owned by one processor is owned by no other processors.
- ① DMAT can be row-contiguous or not, depending on the processor grid and blocking factor used.
- OMAT is locally column-major and globally, it depends...
- GBD is a generalization of the one-dimensional block DMAT distribution. Otherwise there is no relation.
- O DMAT is confusing, but very robust.

00000000

Pros

 Fast for distributed matrix computations

Cons

• Literally everything else

This is why we hide most of the distributed details.

The details are there if you want them (you don't want them).

00000000

Distributed Matrix Methods

pbdDMAT has over 100 methods with *identical* syntax to R:

- `[`, rbind(), cbind(), ...
- lm.fit(), prcomp(), cov(), ...
- `%*%`. solve(), svd(), norm(), ...
- median(), mean(), rowSums(), ...

Serial Code

cov(x)

Parallel Code

cov(x)

pbdDMAT

Comparing pbdMPI and pbdDMAT

pbdMPI:

- MPI + sugar.
- GBD not the only structure pbdMPI can handle (just a useful convention).

pbdDMAT:

- More of a software package.
- DMAT structure must be used for pbdDMAT.
- If the data is not 2d block-cyclic compatible, DMAT will *definitely* give the wrong answer.

0000000

Quick Comments for Using pbdDMAT

Start by loading the package:

```
1 library(pbdDMAT, quiet = TRUE)
```

② Always initialize before starting and finalize when finished:

```
1 init.grid()
2
3 # ...
4
5 finalize()
```

Oistributed DMAT objects will be given the suffix .dmat to visually help distinguish them from global objects. This suffix carries no semantic meaning.

RandSVD

Randomized SVD3

Prototype for Randomized SVD Given an $m \times n$ matrix A, a target number k of singular vectors, and an exponent q (say, q = 1 or q = 2), this procedure computes an approximate rank-2k factorization $U\Sigma V^*$, where U and V are orthonormal, and Σ is

nonnegative and diagonal. Stage A:

- Generate an $n \times 2k$ Gaussian test matrix Ω .
- 2 Form Y = (AA*)^qAΩ by multiplying alternately with A and A*. 3 Construct a matrix Q whose columns form an orthonormal basis for
- the range of Y.
- Stage B: 4 Form $B = Q^*A$.
- Compute an SVD of the small matrix: $B = \tilde{U}\Sigma V^*$.
- 6 Set $U = Q\widetilde{U}$.

Note: The computation of Y in step 2 is vulnerable to round-off errors. When high accuracy is required, we must incorporate an orthonormalization step between each application of A and A^* ; see Algorithm 4.4.

```
Algorithm 4.4: Randomized Subspace Iteration
Given an m \times n matrix A and integers \ell and q, this algorithm computes an
m \times \ell orthonormal matrix Q whose range approximates the range of A.
    Draw an n \times \ell standard Gaussian matrix \Omega.
    Form Y_0 = A\Omega and compute its QR factorization Y_0 = Q_0R_0.
    for j = 1, 2, ..., q
         Form \tilde{Y}_i = A^*Q_{i-1} and compute its QR factorization \tilde{Y}_i = \tilde{Q}_i\tilde{R}_i.
         Form Y_i = A\widetilde{Q}_i and compute its QR factorization Y_i = Q_iR_i.
6
    end
    Q = Q_a.
```

Serial R

```
randSVD \leftarrow function(A, k, g=3)
2
3
        ## Stage A
4
         Omega <- matrix(rnorm(n*2*k),
5
                   nrow=n. ncol=2*k)
        Y <- A %*% Omega
6
        Q \leftarrow ar.Q(ar(Y))
8
         At \leftarrow t(A)

DMAT Exercises

• Experiment with DMAT Examples 1 through 5, running them on 2 and 4 processors.

Advanced DMAT Exercises I

- Subsetting, selection, and filtering are basic matrix operations featured in R. The following may look silly, but it is useful for data processing. Let x.dmat <- ddmatrix(1:30, 10, 3). Do the following:
 - y.dmat <- x.dmat[c(1, 5, 4, 3),]
 y.dmat <- x.dmat[c(10:3, 5, 5),]
 y.dmat <- x.dmat[1:5, 3:1]</pre>
 - y.dmat <- x.dmat[x.dmat[, 2] > 13,]
 y.dmat <- x.dmat[x.dmat[, 2] > x.dmat[, 3],]
 y.dmat <- x.dmat[, x.dmat[2,] > x.dmat[3,]]
 y.dmat <- x.dmat[c(1, 3, 5), x.dmat[, 2] >
 x.dmat[, 3]]

Advanced DMAT Exercises II

- The method crossprod() is an optimized form of the crossproduct computation t(x.dmat) %*% x.dmat. For this exercise, let x.dmat <- ddmatrix(1:30, nrow=10, ncol=3).
 - Verify that these computations really do produce the same results.
 - ② Time each operation. Which is faster?
- The prcomp() method returns rotations for all components. Computationally verify by example that these rotations are orthogonal, i.e., that their crossproduct is the identity matrix.
