## The pbdR Core Team

Wei-Chen Chen<sup>1</sup> George Ostrouchov<sup>2</sup> Pragneshkumar Patel<sup>3</sup> Drew Schmidt<sup>3</sup>

#### Support

This work used resources of National Institute for Computational Sciences at the University of Tennessee, Knoxville, which is supported by the Office of Cyberinfrastructure of the U.S. National Science Foundation under Award No. ARRA-NSF-OCI-0906324 for NICS-RDAV center. This work also used resources of the Oak Ridge Leadership Computing Facility at the Oak Ridge National Laboratory, which is supported by the Office of Science of the U.S. Department of Energy under Contract No. DE-AC05-000R22725.

<sup>&</sup>lt;sup>1</sup>Department of Ecology and Evolutionary Biology University of Tennessee, Knoxville TN, USA

<sup>&</sup>lt;sup>2</sup> Computer Science and Mathematics Division Oak Ridge National Laboratory, Oak Ridge TN, USA

## About This Presentation

#### Speaking Serial R with a Parallel Accent

The content of this presentation is based in part on the **pbdDEMO** vignette *Speaking Serial R with a Parallel Accent* 

http://goo.gl/HZkRt

It contains more examples, and sometimes added detail.

Introduction pbdR pbdMPI GBD Break Stats eg's DMAT pbdDMAT eg's Wrapup

## About This Presentation

#### Installation Instructions

Installation instructions for setting up a pbdR environment are available:

This includes instructions for installing R, MPI, and pbdR.

R and Parallelism

#### Problems with Serial R

- Slow.
- ② If you don't know what you're doing, it's *really* slow.
- Open Performance improvements usually for small machines.
- Very ram intensive.

R and Parallelism

#### Why We Need Parallelism

- Saves compute time.
- ② Data size is skyrocketing.
- Necessary for many problems.
- Its necessity is coming.
- It's really cool.

R and Parallelism

#### R and Parallelism

The solution to many of R's problems is parallelism. However . . .

#### What we have

- Mostly serial.
- Mostly not distributed
- Data parallelism mostly explicit

#### What we want

- Mostly parallel.
- Mostly distributed.
- Mostly implicit.

R and Parallelism

#### R and Parallelism

Likewise, the HPC community is looking for high-level languages for data...

Introduction pbdR pbdMPI GBD Break Stats eg's DMAT pbdDMAT eg's Wrapup

## **Contents**

- 2 pbdR
  - The pbdR Project
  - pbdR Paradigms

The pbdR Project

## Programming with Big Data in R (pbdR)

Striving for Productivity, Portability, Performance

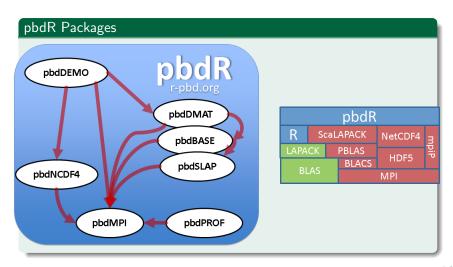

- Free<sup>a</sup> R packages.
- Bridging high-performance C with high-productivity of R
- Scalable, big data analytics.
- Distributed data details implicitly managed.
- Methods have syntax identical to R.
- Powered by state of the art numerical libraries (MPI, ScaLAPACK, . . . )

http://r-pbd.org/ George Ostrouchov pbdR 7/87

<sup>&</sup>lt;sup>a</sup>MPL, BSD, and GPL licensed

The pbdR Project

http://r-pbd.org/ George Ostrouchov pbdR 8/87

The pbdR Project

## Example Syntax

```
1 x <- x[-1, 2:5]

2 x <- log(abs(x) + 1)

3 xtx <- t(x) %*% x

4 ans <- svd(solve(xtx))
```

Look familiar?

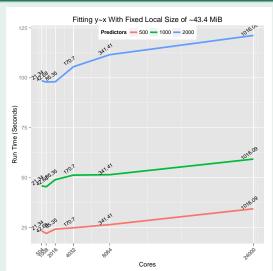

The above runs on 1 core with R or 10,000 cores with pbdR

http://r-pbd.org/ George Ostrouchov pbdR 9/87

The pbdR Project

## Least Squares Benchmark

http://r-pbd.org/ George Ostrouchov pbdR 10/87

The pbdR Project

## Profiling with **pbdPROF**

#### 1. Rebuild **pbdR** packages

```
R CMD INSTALL

pbdMPI_0.2-1.tar.gz \

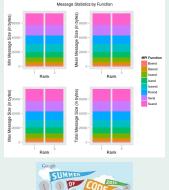

--configure-args= \
"--enable-pbdPROF"
```

#### 2. Run code

```
mpirun -np 64 Rscript
my_script.R
```

#### 3. Analyze results

## Publication-quality graphs

\*OAK RIDGE

pbdR Paradigms

#### pbdR Paradigms

Programs that use pbdR utilize:

- Batch execution
- Single Program/Multiple Data (SPMD) style

And generally utilize:

Data Parallelism

pbdR Paradigms

#### **Batch Execution**

- Non-interactive
- Use

```
1 Rscript my_script.r
```

or

```
1 R CMD BATCH my_script.r
```

• In parallel:

```
1 mpirun -np 2 Rscript my_par_script.r
```

pbdR Paradigms

## Single Program/Multiple Data (SPMD)

- SPMD is a programming paradigm.
- Not to be confused with SIMD.
- SPMD utilizes MIMD architecture computers.
- Arguably the simplest extension of serial programming.

http://r-pbd.org/ George Ostrouchov pbdR 14/87

Introduction pbdR pbdMPI GBD Break Stats eg's DMAT pbdDMAT eg's Wrapup

pbdR Paradigms

## Single Program/Multiple Data (SPMD)

- Difficult to describe, easy to do. . .
- Only one program is written, executed in batch on all processors.
- Different processors are autonomous; there is no manager.
- The dominant programming model for large machines.

http://r-pbd.org/ George Ostrouchov pbdR 15/87

Introduction pbdR pbdMPI GBD Break Stats eg's DMAT pbdDMAT eg's Wrapup

## Contents

- Introduction to pbdMPI

  - Reduce, Gather, Broadcast, and Barrier
  - Other pbdMPI Tools

Managing a Communicator

## Message Passing Interface (MPI)

- MPI: Standard for managing communications (data and instructions) between different nodes/computers.
- Implementations: OpenMPI, MPICH2, Cray MPT, . . .
- Enables parallelism (via communication) on distributed machines.
- Communicator: manages communications between processors.

Managing a Communicator

## MPI Operations (1 of 2)

 Managing a Communicator: Create and destroy communicators.

```
init() — initialize communicator
finalize() — shut down communicator(s)
```

 Rank query: determine the processor's position in the communicator.

```
comm.rank() — "who am I?"
comm.size() — "how many of us are there?"
```

• **Printing**: Printing output from various ranks.

```
comm.print(x)
comm.cat(x)
```

**WARNING**: only use these functions on *results*, never on yet-to-be-computed things.

Managing a Communicator

## Quick Example 1

#### Rank Query: 1\_rank.r

```
library(pbdMPI, quiet = TRUE)
  init()
3
  my.rank <- comm.rank()
  comm.print(my.rank, all.rank=TRUE)
6
  finalize()
```

#### Execute this script via:

#### Sample Output:

```
COMM \cdot RANK = O
mpirun -np 2 Rscript 1_rank.r
                                              [1] 0
                                           2
                                             COMM.RANK = 1
                                              [1] 1
```

http://r-pbd.org/ George Ostrouchov 18/87 pbdR

Managing a Communicator

## Quick Example 2

#### Hello World: 2\_hello.r

```
library(pbdMPI, quiet=TRUE)
init()

comm.print("Hello, world")

comm.print("Hello again", all.rank=TRUE, quiet=TRUE)

finalize()
```

#### Execute this script via:

## mpirun -np 2 Rscript 2\_hello.r

```
1 COMM.RANK = 0
2 [1] "Hello, world"
3 [1] "Hello again"
4 [1] "Hello again"
```

Sample Output:

http://r-pbd.org/ George Ostrouchov pbdR 19/87

Reduce, Gather, Broadcast, and Barrier

# Barrier — Synchronization Barrier **Barrier** Barrier **₩**OAK RIDGE

http://r-pbd.org/ George Ostrouchov pbdR 24/87

Reduce, Gather, Broadcast, and Barrier

#### MPI Operations (2 of 2)

- Reduction: each processor has a number x; add all of them up, find the largest/smallest, ....
   reduce(x, op='sum') reduce to one
- allreduce(x, op='sum') reduce to all
- Gather: each processor has a number; create a new object on some processor containing all of those numbers.
   gather(x) — gather to one allgather(x) — gather to all
- Broadcast: one processor has a number x that every other processor should also have.
   bcast(x)
- Barrier: "computation wall"; no processor can proceed until all processors can proceed.
   barrier()

http://r-pbd.org/ George Ostrouchov pbdR 25/87

Reduce, Gather, Broadcast, and Barrier

#### Quick Example 3

```
Reduce and Gather: 3_gt.r
```

```
library(pbdMPI, quiet = TRUE)
  init()
  comm.set.seed(diff=TRUE)
  n <- sample(1:10, size=1)</pre>
  gt <- gather(n)
  comm.print(unlist(gt))
10
  sm <- allreduce(n, op='sum')</pre>
  comm.print(sm, all.rank=T)
13
  finalize()
```

#### Execute this script via:

#### Sample Output:

```
COMM.RANK = O
mpirun -np 2 Rscript 3_gt.r
                                   2 [1] 2 8
                                     COMM.RANK = O
                                   4 [1] 10
                                     COMM.RANK = 1
                                   6 [1] 10
```

http://r-pbd.org/ George Ostrouchov 26/87 pbdR

Reduce, Gather, Broadcast, and Barrier

#### Quick Example 4

#### Broadcast: 4\_bcast.r

```
library(pbdMPI, quiet=T)
  init()
3
  if (comm.rank() == 0) {
    x <- matrix(1:4, nrow=2)
  } else {
    x <- NULL
8
  }
9
10
  y <- bcast(x, rank.source=0)
11
  comm.print(y, rank=1)
13
  finalize()
```

#### Execute this script via:

#### Random Seeds

000000

**pbdMPI** offers a simple interface for managing random seeds:

- comm.set.seed(diff=TRUE) Independent streams via the rlecuyer package.
- comm.set.seed(seed=1234, diff=FALSE) All processors use the same seed seed=1234
- comm.set.seed(diff=FALSE) All processors use the same seed, determined by processor 0 (using the system clock and PID of processor 0).

## Quick Comments for Using pbdMPI

00000

Start by loading the package:

```
1 library(pbdMPI, quiet = TRUE)
```

Always initialize before starting and finalize when finished:

```
1 init()
2
3 # ...
4
5 finalize()
```

http://r-pbd.org/ George Ostrouchov pbdR 33/87

X10.3

- GBD is distributed. No processor owns all the data.
- ② GBD is non-overlapping. Rows uniquely assigned to processors.
- GBD is row-contiguous. If a processor owns one element of a row, it owns the entire row.
- 4 GBD is globally row-major, locally column-major.
- GBD is often locally balanced, where each processor owns (almost) the same amount of data. But this is not required.

	autai. But time is not required.	_
6	The last row of the local storage of a processor is adjacent (by glo	bal row) to
	the first row of the local storage of next processor (by communicat	or number)
	that owns data.	

GBD is (relatively) easy to understand, but can lead to bottlenecks if you have many more columns than rows.

http://r-pbd.org/ George Ostrouchov pbdR 37/87

GBD: Example 1

## Understanding GBD: Global Matrix

$$x = \begin{bmatrix} x_{11} & x_{12} & x_{13} & x_{14} & x_{15} & x_{16} & x_{17} & x_{18} & x_{19} \\ x_{21} & x_{22} & x_{23} & x_{24} & x_{25} & x_{26} & x_{27} & x_{28} & x_{29} \\ x_{31} & x_{32} & x_{33} & x_{34} & x_{35} & x_{36} & x_{37} & x_{38} & x_{39} \\ x_{41} & x_{42} & x_{43} & x_{44} & x_{45} & x_{46} & x_{47} & x_{48} & x_{49} \\ x_{51} & x_{52} & x_{53} & x_{54} & x_{55} & x_{56} & x_{57} & x_{58} & x_{59} \\ x_{61} & x_{62} & x_{63} & x_{64} & x_{65} & x_{66} & x_{67} & x_{68} & x_{69} \\ x_{71} & x_{72} & x_{73} & x_{74} & x_{75} & x_{76} & x_{77} & x_{78} & x_{79} \\ x_{81} & x_{82} & x_{83} & x_{84} & x_{85} & x_{86} & x_{87} & x_{88} & x_{89} \\ x_{91} & x_{92} & x_{93} & x_{94} & x_{95} & x_{96} & x_{97} & x_{98} & x_{99} \end{bmatrix}_{\mathbf{G}}$$

GBD: Example 2

### Quick Comment for GBD

Local pieces of GBD distributed objects will be given the suffix .gbd to visually help distinguish them from global objects. This suffix carries no semantic meaning.

http://r-pbd.org/ George Ostrouchov pbdR 43/87

pbdMPI Example: Monte Carlo Simulation

## Example 1: Monte Carlo Simulation GBD Algorithm

- Let n be big-ish; we'll take n = 50,000.
- **2** Generate an  $n \times 2$  matrix x of standard uniform observations.
- **3** Count the number of rows satisfying  $x^2 + y^2 \le 1$
- Ask everyone else what their answer is; sum it all up.
- $\odot$  Take this new answer, multiply by 4 and divide by n
- 1 If my rank is 0, print the result.

http://r-pbd.org/ George Ostrouchov pbdR 45/87

### Example 1: Monte Carlo Simulation Code

#### Serial Code

```
1 N <- 50000
2 X <- matrix(runif(N * 2), ncol=2)
3 r <- sum(rowSums(X^2) <= 1)
4 PI <- 4*r/N
5 print(PI)</pre>
```

#### Parallel Code

```
library(pbdMPI, quiet = TRUE)
init()
comm.set.seed(diff=TRUE)

N.gbd <- 50000 / comm.size()
X.gbd <- matrix(runif(N.gbd * 2), ncol = 2)
r.gbd <- sum(rowSums(X.gbd^2) <= 1)
r <- allreduce(r.gbd)
PI <- 4*r/(N.gbd * comm.size())
comm.print(PI)
finalize()
```

http://r-pbd.org/ George Ostrouchov pbdR 46/87

pbdMPI Example: Monte Carlo Simulation

#### Note

For the remainder, we will exclude loading, init, and finalize calls.

http://r-pbd.org/ George Ostrouchov pbdR 47/87

pbdMPI Example: Sample Covariance

### Example 2: Sample Covariance

$$cov(x_{n \times p}) = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \mu_x) (x_i - \mu_x)^T$$

http://r-pbd.org/ George Ostrouchov pbdR 48/87

pbdMPI Example: Sample Covariance

### Example 2: Sample Covariance GBD Algorithm

- lacktriangle Determine the total number of rows N.
- 2 Compute the vector of column means of the full matrix.
- Subtract each column's mean from that column's entries in each local matrix.
- Ompute the crossproduct locally and reduce.
- **1** Divide by N-1.

http://r-pbd.org/ George Ostrouchov pbdR 49/87

## Example 2: Sample Covariance Code

#### Serial Code

```
1 N <- nrow(X)
2 mu <- colSums(X) / N
3
4 X <- sweep(X, STATS=mu, MARGIN=2)
5 Cov.X <- crossprod(X) / (N-1)
6
7 print(Cov.X)</pre>
```

#### Parallel Code

```
N <- allreduce(nrow(X.gbd), op="sum")
mu <- allreduce(colSums(X.gbd) / N, op="sum")

X.gbd <- sweep(X.gbd, STATS=mu, MARGIN=2)
Cov.X <- allreduce(crossprod(X.gbd), op="sum") / (N-1)

comm.print(Cov.X)</pre>
```

Introduction to Distributed Matrices

#### Distributed Matrices

Most problems in data science are matrix algebra problems, so:

Distributed matrices ⇒ Handle Bigger data

http://r-pbd.org/ George Ostrouchov pbdR 54/87

Introduction to Distributed Matrices

#### Distributed Matrices

High level OOP allows native serial R syntax:

```
1 x <- x[-1, 2:5]

2 x <- log(abs(x) + 1)

3 xtx <- t(x) %*% x

4 ans <- svd(solve(xtx))
```

However. . .

Introduction to Distributed Matrices

#### Distributed Matrices

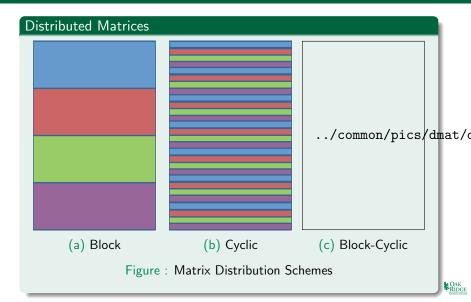

#### DMAT:

- Distributed MATrix data structure.
- No single processor should hold all of the data.
- Block-cyclic matrix distributed across a 2-dimensional grid of processors.
- Very robust, but confusing data structure.

Introduction to Distributed Matrices

### Distributed Matrices

The data structure is a special R class (in the OOP sense) called ddmatrix. It is the "under the rug" storage for a block-cyclic matrix distributed onto a 2-dimensional processor grid.

with prototype

```
\label{eq:new("ddmatrix")} \text{new("ddmatrix")} = \begin{cases} \textbf{Data} &= \texttt{matrix}(0.0) \\ \textbf{dim} &= \texttt{c}(1,1) \\ \textbf{ldim} &= \texttt{c}(1,1) \\ \textbf{bldim} &= \texttt{c}(1,1) \\ \textbf{CTXT} &= 0.0 \end{cases}
```

Introduction to Distributed Matrices

## Distributed Matrices: The Data Structure

Example: an  $9 \times 9$  matrix is distributed with a "block-cycling" factor of  $2 \times 2$  on a  $2 \times 2$  processor grid:

$$= \begin{cases} \textbf{Data} &= \texttt{matrix}(\dots) \\ \textbf{dim} &= \texttt{c}(9, 9) \\ \textbf{Idim} &= \texttt{c}(\dots) \\ \textbf{bIdim} &= \texttt{c}(2, 2) \\ \textbf{CTXT} &= 0 \end{cases}$$

See http://acts.nersc.gov/scalapack/hands-on/datadist.html

pbdDMAT

#### The DMAT Data Structure

- ① DMAT is distributed. No one processor owns all of the matrix.
- ② DMAT is non-overlapping. Any piece owned by one processor is owned by no other processors.
- ① DMAT can be row-contiguous or not, depending on the processor grid and blocking factor used.
- OMAT is locally column-major and globally, it depends...
- GBD is a generalization of the one-dimensional block DMAT distribution. Otherwise there is no relation.
- DMAT is confusing, but very robust.

pbdDMAT

## Pros and Cons of This Data Structure

## Pros

 Fast for distributed matrix computations

## Cons

• Literally everything else

00000000

This is why we hide most of the distributed details.

The details are there if you want them (you don't want them).

http://r-pbd.org/ George Ostrouchov pbdR 72/87

00000000

pbdDMAT

## Distributed Matrix Methods

**pbdDMAT** has over 100 methods with *identical* syntax to R:

- `[`, rbind(), cbind(), ...
- lm.fit(), prcomp(), cov(), ...
- `%\*%`, solve(), svd(), norm(), ...
- median(), mean(), rowSums(), ...

Serial Code

1 cov(x)

Parallel Code

1 cov(x)

pbdDMAT

# Comparing pbdMPI and pbdDMAT

# pbdMPI:

- MPI + sugar.
- GBD not the only structure pbdMPI can handle (just a useful convention).

# pbdDMAT:

- More of a software package.
- DMAT structure must be used for pbdDMAT.
- If the data is not 2d block-cyclic compatible, DMAT will *definitely* give the wrong answer.

http://r-pbd.org/ George Ostrouchov pbdR 74/87

00000000

pbdDMAT

# Quick Comments for Using pbdDMAT

Start by loading the package:

```
1 library(pbdDMAT, quiet = TRUE)
```

Always initialize before starting and finalize when finished:

```
init.grid()

# ...

finalize()
```

Oistributed DMAT objects will be given the suffix .dmat to visually help distinguish them from global objects. This suffix carries no semantic meaning.

http://r-pbd.org/ George Ostrouchov pbdR 75/87

#### Manipulating DMAT Objects

### **Example 1: DMAT Construction**

#### Generate a global matrix and distribute it

```
library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
  # Common global on all processors --> distributed
  x <- matrix(1:100, nrow=10, ncol=10)
  x.dmat <- as.ddmatrix(x)
8 x.dmat
  # Global on processor 0 --> distributed
  if (comm.rank() == 0) {
    v <- matrix(1:100, nrow=10, ncol=10)</pre>
12
13 } else {
    y <- NULL
14
15
16 y.dmat <- as.ddmatrix(y)
17
18 y.dmat
19
20 finalize()
```

Execute this script via:

```
1 mpirun —np 2 Rscript 1_gen.r
```

http://r-pbd.org/ George Ostrouchov pbdR 76/87

## Generate locally only what is needed

```
library(pbdDMAT, quiet=TRUE)
  init.grid()
3
  zero.dmat <- ddmatrix(0, nrow=100, ncol=100)
  zero.dmat
6
  id.dmat <- diag(1, nrow=100, ncol=100, type="ddmatrix")
  id.dmat
9
  comm.set.seed(diff=T)
10
  rand.dmat <- ddmatrix("rnorm", nrow=100, ncol=100,
      mean=10. sd=100)
12
  rand.dmat
13
14
  finalize()
```

Execute this script via:

```
mpirun -np 2 Rscript 2_gen.r
```

http://r-pbd.org/ George Ostrouchov pbdR 77/87

# Example 3: DMAT Operations

## Generate locally only what is needed

```
1 library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
4 x.dmat <- ddmatrix(1:30, nrow=10)
y.dmat <- x.dmat[c(1, 3, 5, 7, 9), -3]
6
7 comm.print(y.dmat)
8 y <- as.matrix(y.dmat)
9 comm.print(y)
10
11 finalize()</pre>
```

Execute this script via:

```
mpirun —np 2 Rscript 3_extract.r
```

http://r-pbd.org/ George Ostrouchov pbdR 78/87

```
library(pbdDMAT, quiet=TRUE)
  init.grid()
3
  x.dmat <- ddmatrix(1:30, nrow=10)
5
  v.dmat <- x.dmat + 1:7
7
  z.dmat <- scale(x.dmat, center=TRUE, scale=TRUE)
9
  y <- as.matrix(y.dmat)
10
  z <- as.matrix(z.dmat)
11
12
  comm.print(y)
13
  comm.print(z)
14
15
  finalize()
16
```

Execute this script via:

http://r-pbd.org/ George Ostrouchov pbdR 79/87

http://r-pbd.org/ George Ostrouchov pbdR 80/87

#### Statistics Examples with pbdDMAT

# Linear Regression

## Serial Code

```
1 tX <- t(X)
2 A <- tX %*% X
3 B <- tX %*% y
4
5 ols <- solve(A) %*% B
6
7 # or
8 ols <- lm.fit(X, y)</pre>
```

#### Parallel Code

```
1 tX <- t(X)
2 A <- tX %*% X
3 B <- tX %*% y
4
5 ols <- solve(A) %*% B
6
7 # or
8 ols <- lm.fit(X, y)
```

http://r-pbd.org/ George Ostrouchov pbdR 81/87

#### Statistics Examples with pbdDMAT

#### Example 5: PCA

### PCA: pca.r

```
library (pbdDMAT, quiet=T)
    init.grid()
2
3
4
5
6
7
   n < -1e4
   p < -250
   comm.set.seed(diff=T)
8
   x.dmat <- ddmatrix("rnorm", nrow=n, ncol=p, mean=100, sd=25)
    pca <- prcomp(x=x.dmat, retx=TRUE, scale=TRUE)</pre>
10
11
    prop_var <- cumsum(pca$sdev)/sum(pca$sdev)</pre>
12
    i \leftarrow max(min(which(prop_var > 0.9)) - 1, 1)
13
14
   v.dmat \leftarrow pca$x[. 1:i]
15
   comm.cat("\nCols: ", i, "\n", quiet=T)
16
   comm.cat("\%Cols:", i/dim(x.dmat)[2], "\n\n", quiet=T)
17
18
19
    finalize()
```

```
Execute this script via:
```

Sample Output:

```
1 mpirun -np 2 Rscript 5_pca.r 1 Cols: 221 %Cols: 0.884
```

http://r-pbd.org/ George Ostrouchov pbdR 82/87

Statistics Examples with pbdDMAT

## Distributed Matrices

**pbdDEMO** contains many other examples of reading and managing GBD and DMAT data

http://r-pbd.org/ George Ostrouchov pbdR 83/87

#### RandSVD

#### Randomized SVD<sup>1</sup>

PROTOTYPE FOR RANDOMIZED SVD Given an  $m \times n$  matrix A, a target number k of singular vectors, and an exponent q (say, q=1 or q=2), this procedure computes an approximate rank-2k factorization  $U\Sigma V^*$ , where U and V are orthonormal, and  $\Sigma$  is nonnegative and diagonal.

#### Stage A:

- Generate an n × 2k Gaussian test matrix Ω.
- 2 Form  $Y = (AA^*)^q A\Omega$  by multiplying alternately with A and  $A^*$ .
  3 Construct a matrix Q whose columns form an orthonormal basis for

#### the range of Y. Stage B:

- 4 Form  $B = Q^*A$ .
- 5 Compute an SVD of the small matrix:  $B = \widetilde{U}\Sigma V^*$ .

6 Set  $U = Q\widetilde{U}$ .

 $Q = Q_a$ .

Note: The computation of Y in step 2 is vulnerable to round-off errors. When high accuracy is required, we must incorporate an orthonormalization step between each application of A and  $A^*$ ; see Algorithm 4.4.

```
ALGORITIM 4.4: RANDOMIZED SUBSPACE ITERATION Given an m \times n matrix A and integers \epsilon and q, this algorithm computes an m \times \ell orthonormal matrix Q whose range approximates the range of A.

1 Draw an n \times \ell standard Gaussian matrix \Omega.

2 Form Y_0 = A\Omega and compute its QR factorization Y_0 = Q_0R_0.

3 for j = 1, 2, \dots, q

4 Form Y_j = A^2Q_{j-1} and compute its QR factorization \tilde{Y}_j = \tilde{Q}_j\tilde{R}_j.

5 Form Y_j = A^2Q_{j-1} and compute its QR factorization Y_j = Q_jR_j.
```
