Programming with Big Data in R

Drew Schmidt and George Ostrouchov

July 8, 2013

Affiliations and Support

The pbdR Core Team http://r-pbd.org

Wei-Chen Chen¹, George Ostrouchov^{1,2}, Pragneshkumar Patel², Drew Schmidt¹

Ostrouchov, Patel, and Schmidt were supported in part by the project "NICS Remote Data Analysis and Visualization Center" funded by the Office of Cyberinfrastructure of the U.S. National Science Foundation under Award No. ARRA-NSF-OCI-0906324 for NICS-RDAV center.

Chen and Ostrouchov were supported in part by the project "Visual Data Exploration and Analysis of Ultra-large Climate Data" funded by U.S. DOE Office of Science under Contract No. DE-AC05-00OR22725.

Computer Science and Mathematics Division, Oak Ridge National Laboratory, Oak Ridge, TN

 $^{^{2}}$ Remote Data Analysis and Visualization Center, University of Tennessee, Knoxville, TN

About This Presentation

Speaking Serial R with a Parallel Accent

The content of this presentation is based in part on the **pbdDEMO** vignette *Speaking Serial R with a Parallel Accent*

https://github.com/wrathematics/pbdDEMO/blob/master/inst/doc/pbdDEMO-guide.pdf?raw=true

It contains more examples, and sometimes added detail.

About This Presentation

Installation Instructions

Installation instructions for setting up a pbdR environment are available:

This includes instructions for installing R, MPI, and pbdR.

About This Presentation

Conventions

We use:

- "•" as a decimal mark
- "," as order of magnitude separator

Example	Yes	No	
One million	1,000,000	1.000.000	
One half	0.5	0,5	
One thousand and one half	1,000.5	1.000, 5

A Concise Introduction to Parallelism

What is Parallelism?

- Doing more than one thing at a time.
- The simultaneous use of multiple compute resources to solve a computational problem.

A Concise Introduction to Parallelism

A Concise Introduction to Parallelism

Parallelism Serial Programming Parallel Programming make_lunch mpirun -np 2 make_lunch_par Get resources make_lunch_par make lunch par Get resources Get resources Work Work Work Work combine Return Return DAK RIDGE

A Concise Introduction to Parallelism

Kinds of Parallelism

- Data Parallelism: Data is distributed
- Task Parallelism: Tasks are distributed

(This is a gross oversimplification)

A Concise Introduction to Parallelism

pbdR Paradigms: Data Parallelism

Data parallelism:

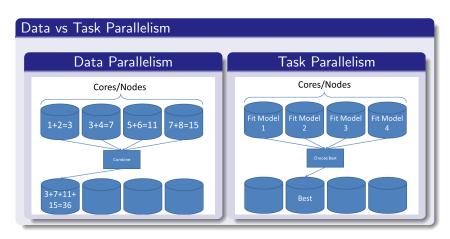

- No one processor/node owns all the data.
- Processors own local pieces of a (conceptually) larger, global object

Task parallelism:

• Often involves different tasks to the same data.

A Concise Introduction to Parallelism

Parallel Programming Vocabulary: Difficulty in Parallelism

- Implicit parallelism: Parallel details hidden from user
- Explicit parallelism: Some assembly required...
- **3** Embarrassingly Parallel: Also called loosely coupled. Obvious how to make parallel; lots of independence in computations.
- Tightly Coupled: Opposite of embarrassingly parallel; lots of dependence in computations.

A Concise Introduction to Parallelism

Speedup

- Wallclock Time: Time of the clock on the wall from start to finish
- Speedup: unitless measure of improvement; more is better.

$$S_{n_1,n_2} = \frac{\text{Run time for } n_1 \text{ cores}}{\text{Run time for } n_2 \text{ cores}}$$

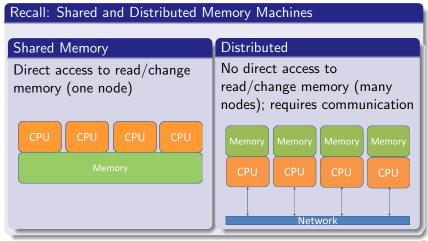

- n_1 is often taken to be 1
- In this case, comparing parallel algorithm to serial algorithm

A Concise Introduction to Parallelism

Speedup Good Speedup Bad Speedup Speedup Application Application - Optimal - Optimal Cores Cores

000000

Problems with Serial R

- Slow.
- ② If you don't know what you're doing, it's really slow.
- 3 Performance improvements usually for small machines.
- Very ram intensive.

R and Parallelism

R and Parallelism

The solution to many of R's problems is parallelism. However . . .

What we have

- Mostly serial.
- 2 Mostly not distributed
- Data parallelism mostly explicit

What we want

- Mostly parallel.
- Mostly distributed.
- Mostly implicit.

The pbdR Project

pbdR Packages — http://code.r-pbd.org

Released to CRAN:

- pbdMPI: MPI bindings (explicit, low-level)
- pbdSLAP: Foreign library (just install it, nothing to use)
- pbdBASE: Compiled code (used by DMAT, also for devs)
- pbdDMAT: Distributed matrices (mostly implicit, high-level)
- pbdNCDF4: Parallel NetCDF4 reader
- pbdDEMO: Package demonstrations, examples, vignette written in textbook style
- pmclust: Parallel model-based clustering.

Future Development:

- Updates and expansions
- Profiling Tools for Parallel Computing with R
- . . .

http://r-pbd.org pbdR Core Team Introduction to pbdR 20 / 99

The pbdR Project

Example Syntax

```
1 x <- x[-1, 2:5]

2 x <- log(abs(x) + 1)

3 xtx <- t(x) %*% x

4 ans <- svd(solve(xtx))
```

Look familiar?

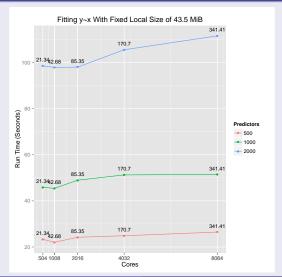

The above runs on 1 core with R or 10,000 cores with pbdR

http://r-pbd.org pbdR Core Team Introduction to pbdR 21/99

The pbdR Project

Least Squares Benchmark

http://r-pbd.org pbdR Core Team Introduction to pbdR 22 / 99

Programs that use pbdR are utilize:

- Batch execution
- Single Program/Multiple Data (SPMD) style

And generally utilize:

Data Parallelism

http://r-pbd.org pbdR Core Team Introduction to pbdR 23/99

pbdR Paradigms

Batch Execution

- Non-interactive
- Use

```
Rscript my_script.r
```

or

```
1 R CMD BATCH my_script.r
```

• In parallel:

```
1 mpirun -np 2 Rscript my_par_script.r
```

http://r-pbd.org pbdR Core Team Introduction to pbdR 24/99

Single Program/Multiple Data (SPMD)

- SPMD is a programming paradigm.
- Not to be confused with SIMD.
- SPMD utilizes MIMD architecture computers.
- Arguably the simplest extension of serial programming.

http://r-pbd.org pbdR Core Team Introduction to pbdR 25 / 99

- Difficult to describe, easy to do. . .
- Only one program is written, executed in batch on all processors.
- Different processors are autonomous; there is no manager.
- The dominant programming model for large machines.

http://r-pbd.org pbdR Core Team Introduction to pbdR 26 / 99

pbdR Paradigms

Contents

- 3 Introduction to pbdMPI
 - Managing a Communicator
 - Reduce, Gather, Broadcast, and Barrier
 - Other pbdMPI Tools

http://r-pbd.org pbdR Core Team Introduction to pbdR

Message Passing Interface (MPI)

- MPI: Standard for managing communications (data and instructions) between different nodes/computers.
- Implementations: OpenMPI, MPICH2, Cray MPT, . . .
- Enables parallelism (via communication) on distributed machines.
- Communicator: manages communications between processors.

http://r-pbd.org pbdR Core Team Introduction to pbdR 28 / 99

MPI Operations (1 of 2)

 Managing a Communicator: Create and destroy communicators.

```
init() — initialize communicator
finalize() — shut down communicator(s)
```

 Rank query: determine the processor's position in the communicator.

```
comm.rank() — "who am I?"
comm.size() — "how many of us are there?"
```

• **Printing**: Printing output from various ranks.

```
comm.print(x)
comm.cat(x)
```

WARNING: only use these functions on *results*, never on yet-to-be-computed things.

Quick Example 1

Rank Query: 1_rank.r

```
library(pbdMPI, quiet = TRUE)
init()

my.rank <- comm.rank()
comm.print(my.rank, all.rank=TRUE)

finalize()</pre>
```

Execute this script via:

Sample Output:

http://r-pbd.org pbdR Core Team Introduction to pbdR 30 / 99

Quick Example 2

Hello World: 2_hello.r

```
library(pbdMPI, quiet=TRUE)
init()

comm.print("Hello, world")

comm.print("Hello again", all.rank=TRUE, quiet=TRUE)

finalize()
```

Execute this script via:

```
mpirun -np 2 Rscript 2_hello.r
```

```
Sample Output:
```

```
COMM.RANK = 0
[1] "Hello, world"
[1] "Hello again"
[1] "Hello again"
```

Reduce, Gather, Broadcast, and Barrier

Barrier — Synchronization Barrier Barrier Barrier

http://r-pbd.org pbdR Core Team Introduction to pbdR 36 / 99

pbdR

Introduction

MPI Operations (2 of 2)

- Reduction: each processor has a number x; add all of them up, find the largest/smallest,
 reduce(x, op='sum') reduce to one allreduce(x, op='sum') reduce to all
- Gather: each processor has a number; create a new object on some processor containing all of those numbers.
 gather(x) — gather to one
 allgather(x) — gather to all
- Broadcast: one processor has a number x that every other processor should also have.
 bcast(x)
- Barrier: "computation wall"; no processor can proceed until all processors can proceed.
 barrier()

http://r-pbd.org pbdR Core Team Introduction to pbdR 37 / 99

Quick Example 3

```
Reduce and Gather: 3_gt.r
```

```
library(pbdMPI, quiet = TRUE)
  init()
3
  comm.set.seed(diff=TRUE)
5
  n <- sample(1:10, size=1)
  gt <- gather(n)
  comm.print(unlist(gt))
10
  sm <- allreduce(n, op='sum')</pre>
  comm.print(sm, all.rank=T)
13
  finalize()
```

Execute this script via:

Sample Output:

```
COMM.RANK = O
1 mpirun -np 2 Rscript 3 gt.r
                                     2 [1] 2 8
                                       COMM.RANK = O
                                     4 [1] 10
                                       COMM.RANK = 1
                                     6 [1] 10
```

http://r-pbd.org pbdR Core Team 38 / 99 Introduction to pbdR

Quick Example 4

Broadcast: 4_bcast.r

```
library(pbdMPI, quiet=T)
  init()
3
  if (comm.rank() == 0) {
    x <- matrix(1:4, nrow=2)
  } else {
    x <- NULL
8
  }
9
10
  v <- bcast(x, rank.source=0)</pre>
11
  comm.print(y, rank=1)
13
  finalize()
```

Execute this script via:

```
mpirun -np 2 Rscript 4_bcast.r
```

Sample Output:

```
COMM.RANK = 1 [,1] [,2] [1,1] [,2] [1,1] [2,1] [2,1] [2,1] [2,1] [2,1]
```

Other pbdMPI Tools

MPI Package Controls

•00000

The .SPMD.CT object allows for setting different package options with **pbdMPI**. See the entry *SPMD Control* of the **pbdMPI** manual for information about the .SPMD.CT object:

http://cran.r-project.org/web/packages/pbdMPI/pbdMPI.pdf

http://r-pbd.org pbdR Core Team Introduction to pbdR 40 / 99

Quick Example 5

```
Barrier: 5_barrier.r
```

000000

```
library(pbdMPI, quiet = TRUE)
  init()
  .SPMD.CT$msg.barrier <- TRUE
  .SPMD.CT$print.quiet <- TRUE
  for (rank in 1:comm.size()-1){
    if (comm.rank() == rank){
      cat(paste("Hello", rank+1, "of", comm.size(), "\n"))
10
    barrier()
11
12
13
  comm.cat("\n")
15
  comm.cat(paste("Hello", comm.rank()+1, "of",
      comm.size(), "\n"), all.rank=TRUE)
17
  finalize()
```

```
Execute this script via:
```

Sample Output:

```
mpirun -np 2 Rscript 5_barrier.r 1 Hello 1 of 2 Hello 2 of 2
```

http://r-pbd.org pbdR Core Team Introduction to pbdR 41/99

Random Seeds

000000

pbdMPI offers a simple interface for managing random seeds:

- comm.set.seed(diff=TRUE) Independent streams via the rlecuyer package.
- comm.set.seed(seed=1234, diff=FALSE) All processors use the same seed seed=1234
- comm.set.seed(diff=FALSE) All processors use the same seed, determined by processor 0 (using the system clock and PID of processor 0).

http://r-pbd.org pbdR Core Team Introduction to pbdR 42 / 99

Quick Example 6

```
Timing: 6_timer.r
  library(pbdMPI, quiet=TRUE)
  init()
  comm.set.seed(diff=T)
   test <- function(timed)
7
    ltime <- system.time(timed)[3]</pre>
8
9
10
    mintime <- allreduce(ltime, op='min')
    maxtime <- allreduce(ltime, op='max')
11
    meantime <- allreduce(ltime, op='sum')/comm.size()
12
13
14
     return (data.frame (min=mintime, mean=meantime,
         max=maxtime))
15
16
  times <- test(rnorm(1e6)) # ~7.6MiB of data
  comm.print(times)
19
  finalize()
```

000000

Execute this script via:

```
mpirun -np 2 Rscript 6_timer.r
```

Sample Output:

```
1 min mean max
2 1 0.17 0.173 0.176
```

http://r-pbd.org pbdR Core Team Introduction to pbdR 43/99

Other Helper Tools

000000

pbdMPI Also contains useful tools for Manager/Worker and task parallelism codes:

- Task Subsetting: Distributing a list of jobs/tasks get.jid(n)
- *ply: Functions in the *ply family.
 pbdApply(X, MARGIN, FUN, ...) analogue of apply()
 pbdLapply(X, FUN, ...) analogue of lapply()
 pbdSapply(X, FUN, ...) analogue of sapply()

http://r-pbd.org pbdR Core Team Introduction to pbdR 44/99

Quick Comments for Using pbdMPI

000000

Start by loading the package:

```
1 library(pbdMPI, quiet = TRUE)
```

2 Always initialize before starting and finalize when finished:

```
init()

init()

finalize()
```

X10 2

- GBD is distributed. No processor owns all the data.
- ② GBD is non-overlapping. Rows uniquely assigned to processors.
- 3 GBD is row-contiguous. If a processor owns one element of a row, it owns the entire row.
- 4 GBD is globally row-major, locally column-major.
- GBD is often locally balanced, where each processor owns (almost) the same amount of data. But this is not required.

	data. But this is not required.	L	710,1	710,2	^10,5]
0	The last row of the local storage of a processor is a	,	()	0	,
	the first row of the local storage of next processor	(by	commu	licator	number)
	that owns data.				

• GBD is (relatively) easy to understand, but can lead to bottlenecks if you have many more columns than rows.

http://r-pbd.org pbdR Core Team Introduction to pbdR 49 / 99

GBD: Example 1

Understanding GBD: Global Matrix

$$x = \begin{bmatrix} x_{11} & x_{12} & x_{13} & x_{14} & x_{15} & x_{16} & x_{17} & x_{18} & x_{19} \\ x_{21} & x_{22} & x_{23} & x_{24} & x_{25} & x_{26} & x_{27} & x_{28} & x_{29} \\ x_{31} & x_{32} & x_{33} & x_{34} & x_{35} & x_{36} & x_{37} & x_{38} & x_{39} \\ x_{41} & x_{42} & x_{43} & x_{44} & x_{45} & x_{46} & x_{47} & x_{48} & x_{49} \\ x_{51} & x_{52} & x_{53} & x_{54} & x_{55} & x_{56} & x_{57} & x_{58} & x_{59} \\ x_{61} & x_{62} & x_{63} & x_{64} & x_{65} & x_{66} & x_{67} & x_{68} & x_{69} \\ x_{71} & x_{72} & x_{73} & x_{74} & x_{75} & x_{76} & x_{77} & x_{78} & x_{79} \\ x_{81} & x_{82} & x_{83} & x_{84} & x_{85} & x_{86} & x_{87} & x_{88} & x_{89} \\ x_{91} & x_{92} & x_{93} & x_{94} & x_{95} & x_{96} & x_{97} & x_{98} & x_{99} \end{bmatrix}$$

Quick Comment for GBD

Local pieces of GBD distributed objects will be given the suffix .gbd to visually help distinguish them from global objects. This suffix carries no semantic meaning.

6 Basic Statistics Examples

pbdMPI Example: Monte Carlo Simulation

• pbdMPI Example: Sample Covariance

pbdMPI Example: Linear Regression

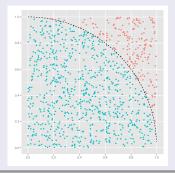

http://r-pbd.org pbdR Core Team Introduction to pbdR

pbdMPI Example: Monte Carlo Simulation

Example 1: Monte Carlo Simulation

Sample *N* uniform observations (x_i, y_i) in the unit square $[0,1] \times [0,1]$. Then

$$\pi pprox 4\left(rac{\#\ \textit{Inside Circle}}{\#\ \textit{Total}}
ight) = 4\left(rac{\#\ \textit{Blue}}{\#\ \textit{Blue} + \#\ \textit{Red}}
ight)$$

http://r-pbd.org pbdR Core Team Introduction to pbdR 56 / 99

pbdMPI Example: Monte Carlo Simulation

Example 1: Monte Carlo Simulation GBD Algorithm

- Let n be big-ish; we'll take n = 50,000.
- **2** Generate an $n \times 2$ matrix x of standard uniform observations.
- **3** Count the number of rows satisfying $x^2 + y^2 \le 1$
- Ask everyone else what their answer is; sum it all up.
- \odot Take this new answer, multiply by 4 and divide by n
- 1 If my rank is 0, print the result.

http://r-pbd.org pbdR Core Team Introduction to pbdR 57/99

pbdMPI Example: Monte Carlo Simulation

Example 1: Monte Carlo Simulation Code

Serial Code

```
N <- 50000
2 X <- matrix(runif(N * 2), ncol=2)
3 r <- sum(rowSums(X^2) <= 1)
4 PI <- 4*r/N
5 print(PI)</pre>
```

Parallel Code

```
library(pbdMPI, quiet = TRUE)
init()
comm.set.seed(diff=TRUE)

N.gbd <- 50000 / comm.size()
X.gbd <- matrix(runif(N.gbd * 2), ncol = 2)
r.gbd <- sum(rowSums(X.gbd^2) <= 1)
r <- allreduce(r.gbd)
PI <- 4*r/(N.gbd * comm.size())
comm.print(PI)
in print(PI)
in pri

pbdMPI Example: Sample Covariance

Example 2: Sample Covariance

$$cov(x_{n \times p}) = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \mu_x) (x_i - \mu_x)^T$$

http://r-pbd.org pbdR Core Team Introduction to pbdR 60 / 99

pbdMPI Example: Sample Covariance

Example 2: Sample Covariance GBD Algorithm

- lacktriangle Determine the total number of rows N.
- Compute the vector of column means of the full matrix.
- Subtract each column's mean from that column's entries in each local matrix.
- Ompute the crossproduct locally and reduce.
- **5** Divide by N-1.

http://r-pbd.org pbdR Core Team Introduction to pbdR 61/99

pbdMPI Example: Sample Covariance

Example 2: Sample Covariance Code

Serial Code

```
1  N <- nrow(X)
2  mu <- colSums(X) / N
3
4  X <- sweep(X, STATS=mu, MARGIN=2)
5  Cov.X <- crossprod(X) / (N-1)
6
7  print(Cov.X)</pre>
```

Parallel Code

```
1 N <- allreduce(nrow(X.gbd), op="sum")
2 mu <- allreduce(colSums(X.gbd) / N, op="sum")
3 
4 X.gbd <- sweep(X.gbd, STATS=mu, MARGIN=2)
5 Cov.X <- allreduce(crossprod(X.gbd), op="sum") / (N-1)
6 
7 comm.print(Cov.X)</pre>
```

Introduction to Distributed Matrices

Distributed Matrices

Most problems in data science are matrix algebra problems, so:

Distributed matrices ⇒ Handle Bigger data

http://r-pbd.org pbdR Core Team Introduction to pbdR 66 / 99

Distributed Matrices

High level OOP allows *native* serial R syntax:

```
1 x <- x[-1, 2:5]

2 x <- log(abs(x) + 1)

3 xtx <- t(x) %*% x

4 ans <- svd(solve(xtx))
```

However. . .

Introduction to Distributed Matrices

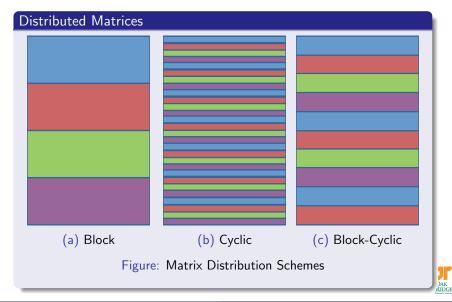

Distributed Matrices

DMAT:

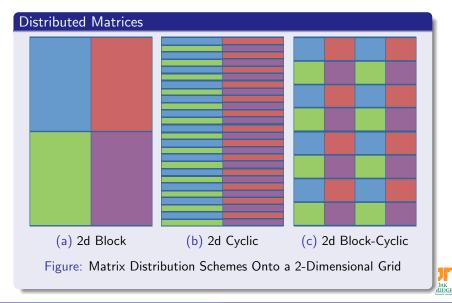

- Distributed MATrix data structure.
- No single processor should hold all of the data.
- Block-cyclic matrix distributed across a 2-dimensional grid of processors.
- Very robust, but confusing data structure.

Introduction to Distributed Matrices

Distributed Matrices

The data structure is a special R class (in the OOP sense) called ddmatrix. It is the "under the rug" storage for a block-cyclic matrix distributed onto a 2-dimensional processor grid.

with prototype

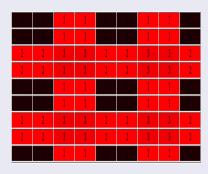

```
\label{eq:new("ddmatrix")} \text{new("ddmatrix")} = \begin{cases} \textbf{Data} &= \texttt{matrix}(0.0) \\ \textbf{dim} &= \texttt{c}(1,1) \\ \textbf{ldim} &= \texttt{c}(1,1) \\ \textbf{bldim} &= \texttt{c}(1,1) \\ \textbf{CTXT} &= 0.0 \end{cases}
```

http://r-pbd.org pbdR Core Team Introduction to pbdR 72 / 99

Distributed Matrices: The Data Structure

Example: an 9×9 matrix is distributed with a "block-cycling" factor of 2×2 on a 2×2 processor grid:

$$= \begin{cases} \textbf{Data} &= \texttt{matrix}(\dots) \\ \textbf{dim} &= \texttt{c}(9, 9) \\ \textbf{Idim} &= \texttt{c}(\dots) \\ \textbf{bIdim} &= \texttt{c}(2, 2) \\ \textbf{CTXT} &= 0 \end{cases}$$

See http://acts.nersc.gov/scalapack/hands-on/datadist.html

http://r-pbd.org pbdR Core Team Introduction to pbdR 73/99

Understanding Dmat: Global Matrix

$$x = \begin{bmatrix} x_{11} & x_{12} & x_{13} & x_{14} & x_{15} & x_{16} & x_{17} & x_{18} & x_{19} \\ x_{21} & x_{22} & x_{23} & x_{24} & x_{25} & x_{26} & x_{27} & x_{28} & x_{29} \\ x_{31} & x_{32} & x_{33} & x_{34} & x_{35} & x_{36} & x_{37} & x_{38} & x_{39} \\ x_{41} & x_{42} & x_{43} & x_{44} & x_{45} & x_{46} & x_{47} & x_{48} & x_{49} \\ x_{51} & x_{52} & x_{53} & x_{54} & x_{55} & x_{56} & x_{57} & x_{58} & x_{59} \\ x_{61} & x_{62} & x_{63} & x_{64} & x_{65} & x_{66} & x_{67} & x_{68} & x_{69} \\ x_{71} & x_{72} & x_{73} & x_{74} & x_{75} & x_{76} & x_{77} & x_{78} & x_{79} \\ x_{81} & x_{82} & x_{83} & x_{84} & x_{85} & x_{86} & x_{87} & x_{88} & x_{89} \\ x_{91} & x_{92} & x_{93} & x_{94} & x_{95} & x_{96} & x_{97} & x_{98} & x_{99} \end{bmatrix}$$

http://r-pbd.org pbdR Core Team Introduction to pbdR 74/99

DMAT: 1-dimensional Row Block

$$X = \begin{bmatrix} X_{11} & X_{12} & X_{13} & X_{14} & X_{15} & X_{16} & X_{17} & X_{18} & X_{19} \\ X_{21} & X_{22} & X_{23} & X_{24} & X_{25} & X_{26} & X_{27} & X_{28} & X_{29} \\ X_{31} & X_{32} & X_{33} & X_{34} & X_{35} & X_{36} & X_{37} & X_{38} & X_{39} \\ \hline X_{41} & X_{42} & X_{43} & X_{44} & X_{45} & X_{46} & X_{47} & X_{48} & X_{49} \\ X_{51} & X_{52} & X_{53} & X_{54} & X_{55} & X_{56} & X_{57} & X_{58} & X_{59} \\ \hline X_{61} & X_{62} & X_{63} & X_{64} & X_{65} & X_{66} & X_{67} & X_{68} & X_{69} \\ \hline X_{71} & X_{72} & X_{73} & X_{74} & X_{75} & X_{76} & X_{77} & X_{78} & X_{79} \\ X_{81} & X_{82} & X_{83} & X_{84} & X_{85} & X_{86} & X_{87} & X_{88} & X_{89} \\ X_{91} & X_{92} & X_{93} & X_{94} & X_{95} & X_{96} & X_{97} & X_{98} & X_{99} \end{bmatrix}$$

Processor grid =
$$\begin{vmatrix} 0 \\ 1 \\ 2 \\ 3 \end{vmatrix} = \begin{vmatrix} (0,0) \\ (0,1) \\ (1,0) \\ (1,1) \end{vmatrix}$$

http://r-pbd.org pbdR Core Team Introduction to pbdR 75/99

DMAT: 2-dimensional Row Block

$$X = \begin{bmatrix} X_{11} & X_{12} & X_{13} & X_{14} & X_{15} & X_{16} & X_{17} & X_{18} & X_{19} \\ X_{21} & X_{22} & X_{23} & X_{24} & X_{25} & X_{26} & X_{27} & X_{28} & X_{29} \\ X_{31} & X_{32} & X_{33} & X_{34} & X_{35} & X_{36} & X_{37} & X_{38} & X_{39} \\ X_{41} & X_{42} & X_{43} & X_{44} & X_{45} & X_{46} & X_{47} & X_{48} & X_{49} \\ X_{51} & X_{52} & X_{53} & X_{54} & X_{55} & X_{56} & X_{57} & X_{58} & X_{59} \\ \hline X_{61} & X_{62} & X_{63} & X_{64} & X_{65} & X_{66} & X_{67} & X_{68} & X_{69} \\ X_{71} & X_{72} & X_{73} & X_{74} & X_{75} & X_{76} & X_{77} & X_{78} & X_{79} \\ X_{81} & X_{82} & X_{83} & X_{84} & X_{85} & X_{86} & X_{87} & X_{88} & X_{89} \\ X_{91} & X_{92} & X_{93} & X_{94} & X_{95} & X_{96} & X_{97} & X_{98} & X_{99} \end{bmatrix}$$

Introduction pbdR pbdMPI GBD Break Stats eg's DMAT pbdDMAT eg's Wrapup

pbdDMAT

The DMAT Data Structure

- ① DMAT is distributed. No one processor owns all of the matrix.
- ② DMAT is non-overlapping. Any piece owned by one processor is owned by no other processors.
- ① DMAT can be row-contiguous or not, depending on the processor grid and blocking factor used.
- OMAT is locally column-major and globally, it depends...
- GBD is a generalization of the one-dimensional block DMAT distribution. Otherwise there is no relation.
- O DMAT is confusing, but very robust.

00000000

http://r-pbd.org pbdR Core Team Introduction to pbdR 83/99

pbdDMAT

Pros and Cons of This Data Structure

Pros

 Fast for distributed matrix computations

Cons

Literally everything else

00000000

This is why we hide most of the distributed details.

The details are there if you want them (you don't want them).

http://r-pbd.org pbdR Core Team Introduction to pbdR 84/99

00000000

pbdDMAT

Distributed Matrix Methods

pbdDMAT has over 100 methods with *identical* syntax to R:

- `[`, rbind(), cbind(), ...
- lm.fit(), prcomp(), cov(), ...
- `%*%`, solve(), svd(), norm(), ...
- median(), mean(), rowSums(), ...

pbdDMAT

Comparing pbdMPI and pbdDMAT

pbdMPI:

- MPI + sugar.
- GBD not the only structure pbdMPI can handle (just a useful convention).

pbdDMAT:

- More of a software package.
- DMAT structure must be used for pbdDMAT.
- If the data is not 2d block-cyclic compatible, DMAT will *definitely* give the wrong answer.

http://r-pbd.org pbdR Core Team Introduction to pbdR 86/99

Quick Comments for Using pbdDMAT

Start by loading the package:

```
1 library(pbdDMAT, quiet = TRUE)
```

② Always initialize before starting and finalize when finished:

```
1 init.grid()
2
3 # ...
4
5 finalize()
```

Oistributed DMAT objects will be given the suffix .dmat to visually help distinguish them from global objects. This suffix carries no semantic meaning.

Manipulating DMAT Objects

Example 1: DMAT Construction

```
Generate a global matrix and distribute it
```

```
library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
  # Common global on all processors --> distributed
  x <- matrix(1:100, nrow=10, ncol=10)
  x.dmat <- as.ddmatrix(x)
8 x.dmat
10 # Global on processor 0 --> distributed
  if (comm.rank() == 0) {
    v <- matrix(1:100, nrow=10, ncol=10)</pre>
12
 } else {
13
    y <- NULL
14
15
16 y.dmat <- as.ddmatrix(y)
17
18 y.dmat
19
20 finalize()
                            Execute this script via:
```

```
1 mpirun —np 2 Rscript 1_gen.r
```

http://r-pbd.org pbdR Core Team Introduction to pbdR 88 / 99

Manipulating DMAT Objects

Example 2: DMAT Construction

Generate locally only what is needed

```
library(pbdDMAT, quiet=TRUE)
  init.grid()
3
  zero.dmat <- ddmatrix(0, nrow=100, ncol=100)
  zero.dmat
6
  id.dmat <- diag(1, nrow=100, ncol=100, type="ddmatrix")
  id.dmat
9
  comm.set.seed(diff=T)
10
  rand.dmat <- ddmatrix("rnorm", nrow=100, ncol=100,
       mean = 10, sd = 100)
12
  rand.dmat
13
14
  finalize()
```

Execute this script via:

mpirun -np 2 Rscript 2_gen.r

pbdR Core Team 89 / 99 http://r-pbd.org Introduction to pbdR

Example 3: DMAT Operations

Generate locally only what is needed

```
1 library(pbdDMAT, quiet=TRUE)
2 init.grid()
3
4 x.dmat <- ddmatrix(1:30, nrow=10)
y.dmat <- x.dmat[c(1, 3, 5, 7, 9), -3]
6
7 comm.print(y.dmat)
8 y <- as.matrix(y.dmat)
9 comm.print(y)
10
11 finalize()</pre>
```

Execute this script via:

```
mpirun —np 2 Rscript 3_extract.r
```

http://r-pbd.org pbdR Core Team Introduction to pbdR 90 / 99

Example 4: GBD and DMAT

```
library(pbdDEMO, quiet=TRUE)
   init.grid()
3
   comm.set.seed(diff = TRUE)
5
   N.gbd \leftarrow 1 + comm.rank()
   X.gbd \leftarrow matrix(rnorm(N.gbd * 3), ncol = 3)
8
9
   # convert GBD to DMAT
   X.dmat <- gbd2dmat(X.gbd)</pre>
10
11
12
   # convert DMAT to GBD
13
   new.X.gbd <- dmat2gbd(X.dmat)</pre>
14
15
   # undistribute
  X <- as.matrix(X.dmat)</pre>
16
17
  finalize()
18
```

Linear Regression

Serial Code

```
1 tX <- t(X)
2 A <- tX %*% X
3 B <- tX %*% y
4
5 ols <- solve(A) %*% B
6
7 # or
8 ols <- lm.fit(X, y)</pre>
```

Parallel Code

```
1 tX <- t(X)
2 A <- tX %*% X
3 B <- tX %*% y
4
5 ols <- solve(A) %*% B
6
7 # or
8 ols <- lm.fit(X, y)</pre>
```

http://r-pbd.org pbdR Core Team Introduction to pbdR 93 / 99

Statistics Examples with pbdDMAT

Example 5: PCA

PCA: pca.r

```
library(pbdDMAT, quiet=T)
    init.grid()
2
3
4
5
6
7
   n <- 1e4
   p <- 250
   comm. set . seed ( diff=T)
8
   x.dmat <- ddmatrix("rnorm", nrow=n, ncol=p, mean=100, sd=25)
10
    pca <- prcomp(x=x.dmat. retx=TRUE, scale=TRUE)</pre>
11
    prop_var <- cumsum(pca$sdev)/sum(pca$sdev)</pre>
12
    i \leftarrow max(min(which(prop_var > 0.9)) - 1, 1)
13
14
   y.dmat \leftarrow pcax[, 1:i]
15
   comm.cat("\nCols: ", i, "\n", quiet=T)
16
   comm. cat("\%Cols:", i/dim(x.dmat)[2], "\n\n", quiet=T)
17
18
19
    finalize()
```

Execute this script via:

Sample Output:

```
1 mpirun -np 2 Rscript 5-pca.r 1 Cols: 221 %Cols: 0.884
```

RandSVD

Randomized SVD3

Prototype for Randomized SVD

Given an $m \times n$ matrix A, a target number k of singular vectors, and an exponent q (say, q = 1 or q = 2), this procedure computes an approximate rank-2k factorization $U\Sigma V^*$, where U and V are orthonormal, and Σ is nonnegative and diagonal.

Stage A:

- Generate an $n \times 2k$ Gaussian test matrix Ω .
- 2 Form Y = (AA*)^qAΩ by multiplying alternately with A and A*. 3 Construct a matrix Q whose columns form an orthonormal basis for

the range of Y. Stage B:

- 4 Form $B = Q^*A$.
- Compute an SVD of the small matrix: $B = \tilde{U}\Sigma V^*$.
- 6 Set $U = Q\widetilde{U}$.

Note: The computation of Y in step 2 is vulnerable to round-off errors. When high accuracy is required, we must incorporate an orthonormalization step between each application of A and A^* ; see Algorithm 4.4.

Algorithm 4.4: Randomized Subspace Iteration Given an $m \times n$ matrix A and integers ℓ and q, this algorithm computes an $m \times \ell$ orthonormal matrix Q whose range approximates the range of A. Draw an $n \times \ell$ standard Gaussian matrix Ω . Form $Y_0 = A\Omega$ and compute its OR factorization $Y_0 = Q_0R_0$.

- for j = 1, 2, ..., qForm $\tilde{Y}_i = A^*Q_{i-1}$ and compute its QR factorization $\tilde{Y}_i = \tilde{Q}_i\tilde{R}_i$.
- Form $Y_i = A\widetilde{Q}_i$ and compute its QR factorization $Y_i = Q_iR_i$. 6 end
- $Q = Q_a$.
